LETTER OF TRANSMITTAL

September 1, 1936.

*To His Excellency, FRANK F. MERRIAM,
Governor, State of California,
Sacramento.*

SIR: In compliance with the provisions of section 32 of the Fish and Game Code, we submit herewith the Thirty-fourth Biennial Report of the Fish and Game Commission, covering the period July 1, 1934, to June 30, 1936.

The report consists of a summary of the activities of the Fish and Game Commission. A brief summary by the Executive Officer and detailed reports by the chiefs of all bureaus. In addition, there are complete statistical reports covering the receipts and disbursements, as well as statistics on fish and game management.

We wish to express our appreciation to the Governor of California and to the heads of all the various state departments with whom we have had the pleasure of working, and to the members of the legislature for the splendid sympathetic cooperation which they have given to the administration of fish and game.

Respectfully submitted.

E. C. MOORE, President.
I. ZELLERBACH, Commissioner.
A. T. JERGENS, Commissioner.

THIRTY-FOURTH BIENNIAL REPORT

REPORT OF BOARD OF FISH AND GAME COMMISSIONERS TO THE GOVERNOR OF CALIFORNIA

This biennial report, covering the period July 1, 1934, to June 30, 1936, is unique in several respects because it covers a transitional period in the administration of fish and game in the State of California. A number of things have occurred to bring about this transition.

First, the people of the State of California as well as throughout the entire United States during this period suddenly realized that their fish and game resources were being subjected to a strain which they might not survive, but also realized that the use of these resources was a major item in the economic structure of the State, and their perpetuation, preservation and rehabilitation was vitally necessary.

Another factor influencing the transition was the willingness on the part of the government of the State of California to readily adjust itself to this recognition being given to fish and game by the people. For the first time in many years, the Governor of California personally sponsored a program designed to accomplish the perpetuation of our fish and game resources.

On November 5, 1934, your excellency announced a program for the management of fish and game consisting of six major points, which it has been the pleasure and privilege of your Board of Fish and Game Commissioners to carry out. We believe that every point in this program has been put into effect.

The results of this program are already becoming visible in terms of fish and game reaching the hunters' and fishermen's bag and creel.

May we pause at this point to compliment and congratulate you in having given to the State this sound and comprehensive program, and may we also congratulate the State of California for having a chief executive willing and able to formulate this program and assume the leadership in fundamental conservation.

Your program necessitated a good many changes in the structure of the Division of Fish and Game and in its procedure. Since it was first organized in 1870 the Fish and Game Commission has accumulated a vast amount of knowledge of the vital points necessary for the successful management of fish and game, giving us a broad, solid foundation upon which to build the new and reorganized structure for the future management and control of these resources along the lines outlined by you, thus making it possible intelligently and with fundamental soundness to launch this long-time and far-reaching program, looking well into the future, building not only for today but for all time to come.

Your first point in your program called upon the people of the state to stand united on conservation policies, requesting their active

support to carry them out. This first point has been accomplished even beyond our fondest hopes.

Prior to this time, the various organizations of conservation and your Fish and Game Commission were somewhat separated, these organizations, in some instances, having come into existence largely for the purpose of influencing the state and its Fish and Game Commission to do certain things which they desired. The Fish and Game Commission found itself almost always in the defensive position. Your policy has caused a complete reversal of this condition. Your Commission is no longer on the defensive, but has definitely assumed the leadership in conservation, and the organized conservationists have unanimously welcomed this leadership and have united with the Fish and Game Commission to reach the common goal. They have truly undertaken to carry on the conservation work to a point far beyond that which your Fish and Game Commission could reach with the available finances. They have educated the public and the courts to an appreciation of the value of our resources. They have themselves aided in propagation and restoration. They have counseled and advised with your Commission. They have put California in the forefront in the management of fish and game through their united support.

The second point in your program called for the establishment of a sound and far-reaching method of management, looking not only to the restoration of what has been lost of the resources but to a perpetuation for future use. We are proud to report to you that the program of your Commission has been completely reorganized to obtain this end. Sound and economic methods of production are in vogue looking to restoration. Sound methods of statistical analyses of the annual take have been put into effect with a view to treating the fish and game management as a merchandising enterprise. We now have the facts on which to base our replacement of each year's take, and then to add a little more so that the fishing and hunting may be improved and still have an adequate supply for the future.

Point three in your program called for the prevention of wanton, careless and malicious destruction of fish and game. We are pleased to report that this program has received our specific attention in four directions. First, to prevent the destruction of fish through losses by diversion of water we reestablished the bureau in the Division to handle the installation of fish screens and fishways. Because of the peculiarities of the laws on this subject, there has been some delay in accomplishment. However, just before the close of the biennial period, we succeeded in arranging a cooperative set-up with the United States Forest Service and the Civilian Conservation Corps, and screens are now in course of construction. The principal destruction of game comes through fire. Your Commission is pleased to report that they have made every effort to impress upon the people of the State of California that the prevention of fire is vitally necessary in the protection of fish and game and to this end the personnel of this Division has lent every effort, cooperating with and receiving the cooperation of your State Division of Forestry, State Division of Parks and the U. S. Forest Service.

The third item of destruction is pollution of the waters of the State. The personnel for attacking this problem has been trebled and

we are pleased to report that more has been accomplished in this direction during the past two years than at any time in the history of the state. The control of oil leakages in southern California has restored some valuable fishing waters in that area, also caused a marked decrease in the amount of pollution on the beaches. In other sections of the State equally encouraging results have been obtained in controlling industrial wastes in the Eel River, in the Sacramento and San Joaquin rivers and in many other places. The fourth item of destruction is the predatory bird and mammal. During the biennium, a comprehensive program of predatory animal control has been established. The personnel assigned to this work has been increased from four to fifteen, and it is anticipated that this number will be doubled during the next biennium. An informal, cooperative arrangement has been made with the United States Bureau of Biological Survey and the State Department of Agriculture, the other two agencies concerned with predatory animal control. Through this informal, cooperative agreement, each of the three agencies, including ourselves, have undertaken the responsibility of predatory animal control in definite areas, eliminating overlapping and providing for increased control of the predator.

The fourth point in your program is adequate law enforcement. We are happy to report to you the complete reorganization of the California Fish and Game Patrol. This body of men with no increase in its personnel has been so reorganized and rehabilitated that today by comparison we feel that it is one of the outstanding conservation patrols in the United States. The men have more than doubled the effectiveness of their work. They have willingly and gladly adopted your theory of enforcement to protect the game by preventing violations thereby conserving the supply and making the apprehension of the violator of secondary importance to prevention. We have increased the number of boats for ocean patrol work in order to more adequately protect the sport and commercial fishing resources along the 1300 mile coastline of this State, an area which today provides fishing in an abundance found nowhere else in this country.

The fifth point in your program called for adequately dealing with the perpetuation of the California sardine industry with particular reference to control of the outside floating reduction plants. Your Commission has worked diligently on this matter for two years and believes that it has made very definite headway by getting the industry itself to realize the necessity for this control. Your Commission has also been able to demonstrate that the exploitation of this resource has reached and passed its maximum and that control is absolutely necessary in order to prevent the destruction of the fishery. We are pleased to report that your Commission, the industry which uses the sardine onshore and the organized conservationists of the State are united. There remains only the accomplishment of legislation to attain the desired results.

Your sixth and last point dealt with the enlisting of the services of competent and experienced men. To this end, we are pleased to report that the reorganization of the Division of Fish and Game which we have effected for the purpose of carrying out your program has provided definitely for the selection and training of competent men

for the future. Your Division is now organized into six bureaus each headed by a competent and trained specialist protected under the civil service law. These six bureau heads constitute the backbone of the entire structure of the Division, and are the men through whom your Commission carries out its program. We have provided for an apprentice grade under civil service through which to recruit young men of educational and personal qualifications suitable for fish and game work. These men are given a thorough course of training in this apprentice grade and it will be from these young men that most of the personnel of the Division will come in the future. Thus, giving to the State competent, trained and experienced personnel to carry out the long-time program of fish and game management.

We are proud to have been able to get each of your points in your program underway during this biennium. This will enable us to enter the next biennium with a complete and well-worked out program so that you may watch with us the progress which is bound to result.

Respectfully submitted,

E. C. MOORE, President.

I. ZELLERBACH, Commissioner.

A. T. JERGENS, Commissioner.

REPORT OF THE EXECUTIVE OFFICER TO THE BOARD OF OF FISH AND GAME COMMISSIONERS

Your Executive Officer is pleased to report that during the past biennium the Division of Fish and Game has accomplished the reorganization directed by you. The Division now consists of six bureaus as follows:

- Bureau of Fish Conservation, Dr. J. O. Snyder, Chief.
- Bureau of Game Conservation, J. S. Hunter, Chief.
- Bureau of Patrol, E. L. Macaulay, Chief.
- Bureau of Commercial Fisheries, N. B. Scofield, Chief.
- Bureau of Hydraulics, John Spencer, Chief.
- Bureau of Licenses, H. R. Dunbar, Chief.

The scope of work of each bureau has been definitely extended so that your entire program of fish and game management is well underway. The six bureau heads now constitute a working cabinet through which your personnel is all directed and your program carried out. Your Executive Officer acts as coordinator of the activities of the various bureaus and as liaison between these directing heads and yourselves.

Your Executive Officer is submitting as a part of his report a brief summary of the activities of each of these bureaus during the biennium. In addition, your Executive Officer is submitting a detailed report of each bureau.

During the biennium, certain economies have been effected in the executive office. The positions of assistant executive officer, lecturer, publicity man and chief, Bureau of Research and Education, have been abolished and no new positions created to take their place, thus reducing the salary and expense account item from approximately \$18,000 per year to \$7,000 per year.

In addition, it is our belief that the total output in terms of effort and fish and game has been materially increased through reorganization and revitalization with no appreciable increase in personnel and expense.

Your new fiscal policy which consisted of making each activity of the division self-supporting as far as possible has been put into effect. The budget for the coming biennium has been written under this policy. All money received from hunting licenses being returned to the protection, preservation, propagation and administration of game; and the money received from fishing licenses to the protection, preservation, propagation and administration of fish; the money received from commercial fisheries is already restricted by law to the protection, preservation, research and administration of commercial fisheries.

During the biennium, your executive officer has made two trips outside the State of California. One in September, 1935, to Santa Fe,

New Mexico, and Tulsa, Oklahoma, to meet with the Western Association of Fish and Game Commissioners and the International Association, as well as the American Fisheries Society. The second time, was for the purpose of going to Washington, D. C., to appear before the congressional committee considering legislation looking toward the control of the floating reduction plants.

There have been some changes during this biennium in the personnel of the Commission and the executive office. At the opening of the biennium, the Board of Fish and Game Commissioners consisted of Mr. J. Dale Gentry, President; Mr. Earl B. Gilmore and Mr. I. Zellerbach. Major John L. Farley was the Executive Officer. On December 11, 1934, the Governor of California appointed Mr. Charles N. Cotton as a member of the Board of Fish and Game Commissioners, vice Earl B. Gilmore, resigned. On December 15, 1934, the Board of Fish and Game Commissioners employed Mr. Herbert C. Davis as Executive Officer, to replace Major John L. Farley. On February 1, 1935, the Governor of California appointed Dr. E. C. Moore and on February 5, 1935, Mr. C. E. Houchin as members of the Board of Fish and Game Commissioners, vice J. Dale Gentry, resigned February 4, 1935, and Charles N. Cotton, resigned. On February 9, 1935, the Board of Fish and Game Commissioners met and selected Dr. E. C. Moore President. On January 7, 1936, the Governor of California appointed Mr. A. T. Jergins, Commissioner, vice C. E. Houchin, resigned.

At the close of the biennium, the Board of Fish and Game Commissioners consisted of Dr. E. C. Moore, President, I. Zellerbach and A. T. Jergins, with Herbert C. Davis as Executive Officer and secretary to the Commission.

LIBRARY

The condition of the library on the whole is healthy. There has been an increase of 346 in the number of bound volumes, valued at \$1,201.08. This has come about despite the continued reduced budget. Under the projects SERA and WPA 951, the accumulated periodicals have been bound, accessioned, and evaluated, making total volumes ending this period 1771. These represent \$381.69 by gifts and \$819.39 by purchase.

Scientific and other pamphlets received during this period have amounted to 806, valued at \$89.54; total accessioned to date 1500.

The number of periodicals regularly received has been reduced, either by discontinuance of publication and/or "exchange" privilege. Those received and circulated number 125.

On September 1, 1935, the library was taken from the Bureau of Education and Research and placed under the supervision of the Executive Officer, as the former bureau was abolished. Effective this date the librarian's time was increased somewhat over the last period.

I submit below a brief summary of the reports of each bureau which are attached hereto in their entirety.

BUREAU OF FISH CONSERVATION

This bureau, the former Bureau of Fish Culture, has succeeded in so coordinating its activities during the biennium that it now functions as a single unit rather than as a group of individuals. As a result of

this unification of effort, the improvement of hatchery methods and the adoption of a sound fish planting policy, great strides have been made in its primary function, the production of trout and salmon. An increase in the production of small mouth bass has been assured by the completion of the Central Valleys Hatchery near Elk Grove, which will be devoted entirely to the production of spiny rayed fishes. The duties of fish rescue, which have been assumed by the Bureau of Fish Conservation, are being coordinated with the spiny rayed fish production program.

The research activities of this bureau are closely correlated with production and distribution. Among the problems that have been considered are the weighing and counting system of enumerating the hatchery output, diet and disease control, the maintenance of an egg supply on a salvage basis, stream and lake surveys, and the consideration of the role played by the so-called rough fish in the waters of the State. The improvement and upkeep of the twenty-six hatcheries and twenty-seven egg taking stations constitutes a problem in itself which has been made easier of solution by an efficient system of hatchery inspection. Extensive construction and improvement have been accomplished through government relief agencies, notably the new hatcheries at Basin Creek, Prairie Creek and Elk Grove.

The Cooperative Trout Investigation, in which the California Division of Fish and Game, the United States Bureau of Fisheries and Stanford University have been taking part, has just completed four years of activity which has resulted in the uncovering of a large amount of valuable information, much of which has already been published.

BUREAU OF GAME CONSERVATION

The Bureau of Game Refuges and the Bureau of Game Propagation were combined during the biennium into one organization, the Bureau of Game Conservation. All Division functions having to do with game birds and mammals are being administered by this bureau.

Since this reorganization, there has been laid the foundation for game management in California based on the determination of the annual kill of our several game species through the compilation of statistics provided by sportsmen on their hunting license applications. The employment of the statistical method in the solution of game problems is only now in its second year, but the results have been extremely gratifying.

The state game farms have increased their production considerably during the biennium. This has been due to the continued improvement of game farming methods and to the employment of some eight hundred additional holding pens provided by sportsmen throughout the state. The quail refuge program that is being conducted in connection with the Los Serranos Game Farm in southern California, is demonstrating the degree to which natural propagation may be stimulated by management practice.

The maintenance, at a high degree of efficiency, of the waterfowl refuges and the observation of waterfowl conditions has been continued. Studies have been made of California's big game herds, particularly the mule deer and antelope of the northeastern corner of the

State, and will provide the basis for the determination of future policies.

The predatory animal control program has been pursued with more than usual vigor due to an increase in the funds available for the work. The results have been pleasing, not only to the sportsmen but to the stockmen as well.

BUREAU OF PATROL

The Bureau of Patrol has undergone a number of changes for the better during the biennium. The reorganization of the patrol districts and the administration of them, the uniforming of the patrol force and a general overhauling of patrol activities has resulted in a new high degree of efficiency and a consequent increase in the number of arrests and convictions. The addition of two new boats to the fleet that patrols our bay and coastal waters has enabled California's "navy" to keep pace with the land forces in increased activity and efficiency.

The creation of the civil service grade of Assistant Warden has met with unanimous approval. These young men, the first of whom are now being trained in all phases of Division activity, constitute the group from which our future wardens will be drawn.

Major changes in bureau activities have been the transfer of fish planting to another bureau and the assumption of a large part of the work necessary to control the pollution of California waters.

During the biennium the patrol force was made smaller by the retirement of two captains and three wardens, and by the death of Warden K. J. Ramsdell.

BUREAU OF COMMERCIAL FISHERIES

This last biennium, with the landings of fish and shell fish in California exceeding the billion-pound mark for the first time in 1934 and again in 1935, has been one of increased activity for the Bureau of Commercial Fisheries. The sardine fishery, the largest in the State, has of course received the most attention. This bureau continues to provide the Fish and Game Commission with biological and statistical ammunition for use in its fight against sardine exploitation, a contest which has been made much more complicated during the last two years by the increasing activity of off-shore reduction plants, which must come under State control before sardine conservation can be accomplished.

California's rapidly growing mackerel fishery is demanding more time and attention and promises to become of still greater importance. The solution of major problems in connection with the oyster industry is being undertaken and a fight to save the remnant of California's salmon fishery is imminent.

The California State Fisheries Laboratory at Terminal Island is carrying on research work which has as its goal the determination for each of our more important fisheries the point at which over utilization occurs so that a maximum yield may be established for each fishery. The major research projects at the present time are sardines, mackerel, tuna, the flat fishes, sport catch records and the compilation of statistics. The minor research studies are numerous and include, among other things, migration studies of striped bass, depletion studies of

the Pismo clam, and a study of Monterey Bay which is being carried on in cooperation with Stanford University.

Six fish bulletins and numerous short articles have been published by members of the laboratory staff during the biennium.

FISH EXCHANGE

According to the requirements set forth in Chapter 825, Statutes of 1933, the Fish Exchange unit of the Bureau of Commercial Fisheries was abolished on June 30, 1936. During the year 1934-35 this unit carried on an extensive publicity campaign for the purpose of increasing the consumption of fresh fish. As a part of this program exhibits were shown at the state and county fairs, cooking demonstrations were held and recipe books were distributed to housewives. In addition, over 1200 retail dealers were contacted and given advice relative to the improvement of fresh fish marketing methods.

BUREAU OF HYDRAULICS

This bureau was reestablished during 1935 after a period of inactivity which was the result of the passage of a bill requiring the Division to pay one-half of the cost of screening diversions which are destructive to game fish. The personnel of the bureau has been engaged in preparing plans and specifications for fish screens which will be constructed as funds are made available. Plans have been formulated for the screening of some 250 diversions in the Klamath River drainage basin alone.

The reinstallation of the fishway at the Benbow Dam on the South Fork of the Eel River and the careful testing of the Burkey electric fish stop have been supervised by engineers connected with this bureau. In addition, the routine inspection of existing fish screens and ladders is being carried on as part of the every day work of the hydraulic staff.

BUREAU OF LICENSES

The Division is supported entirely by the sale of licenses, the income from privilege taxes and fines for the violation of game laws, and it is therefore gratifying to note that this bureau reports a substantial increase in the income of the Division during the biennium just ended. A comparative analysis of the income of the Division during the past four bienniums is an interesting addition to the usual financial statement.

The adoption of a new style of license identification button became effective in 1935 and, during that same year, a blank on which each sportsman was asked to list the amount of fish or game taken during the preceding year was made a part of the hunting and fishing license applications. Boats, catering to fishermen for profit, were licensed during 1935 and the section of the Fish and Game Code which requires a license to angle for game fish in the ocean was enforced for the first time during 1936.

To facilitate the sale of licenses the adoption of a uniform system of license distribution has been urged. Licenses are distributed to vendors at the present time by three separate and distinct methods.

On behalf of the personnel of the Division of Fish and Game the Executive Officer desires to express their gratitude to the Board of Fish and Game Commissioners and to the Governor of California for their sympathetic understanding of our problems, and also for the splendid program of fish and game management which you have provided for us to execute.

Respectfully submitted.

HERBERT C. DAVIS,
Executive Officer.

REPORT OF THE BUREAU OF FISH CONSERVATION

By J. O. SNYDER, Chief

The former Bureau of Fish Culture is now known as the Bureau of Fish Conservation. This slight change in name carries with it an unmeasured amount of added responsibility. It definitely expresses the theory that fish propagation is a part of fish conservation. Fortunately the State of California has not reached the condition when natural propagation is a thing of the past. Artificial propagation and the distribution of its product must therefore take into account the work of nature, so long as and wherever that remains productive. The introduction or spread of competing species must be guarded with the greatest care. Artificial propagation should be self sustaining in all cases excepting only where the taking of wild eggs is plainly salvage. Furthermore, the interest of the bureau rests not with the production of small fish alone, but is extended through transportation and planting, even to the angler's basket. The change in name may also assume that the bureau is in a measure responsible for such scientific inquiries or investigations as pertain to the game fishes. The operations of the various hatcheries are now completely coordinated, each having lost something of its previously assumed sectional and individual importance. Each employee now has an opportunity to regard himself as one of a large organization, while his interests are broadened accordingly.

The experimental propagation of bass has completed its fourth year and amply demonstrated its feasibility in this region. Brood stocks of small mouth bass have been spawned, fish have been successfully hatched and reared, methods of transportation and planting have been tested, and fish produced at the experimental plant have been traced to the angler's basket. Kentucky bass have been introduced to the ponds at Friant where a brood stock is now established, and from where one small experimental planting has been made. It now remains for those in charge to execute a definite plan of distribution for both of these species, and determine the results of the work as accurately as possible, that these may be balanced against the cost.

There is a constantly recurring agitation for the introduction of exotic species of fish. While some requests and suggestions are so evidently ill-considered as to be dismissed at once, others remain to be brought up from time to time. Our native species together with those already introduced furnish an ample fauna, and if with proper conservation and propagation these can not be made to sustain a reasonable amount of sport fishing, the remedy is not to be found in the introduction of other species. The introduction of a foreign species may be simple enough while the result may be appalling.

In assuming charge of the duties of fish rescue by this bureau the activities of that work and the propagation of spiny rayed fishes have

been combined. The work is now centralized at the Central Valleys Hatchery near Elk Grove, which is nearing completion. This consists of numerous stock and brood ponds of various areas, daphnia ponds, a deep well capable of supplying ample water, residences for foreman and aids, laboratory and office, garages and storage buildings. These are on a tract of 40 acres well located in relation to transportation, being near the center of the region of sunfish and bass fishing. Desirable rescued fish may be held at this station until opportunity offers to transport them to places where their introduction is most needed. The operation of this new plant in connection with fish rescue is intended to provide for growth and expansion while adding economies and efficiency to both propagation and rescue.

The recently adopted enumerating system which is a combination of weighing and counting is now in effect. It has already proven its worth in furnishing fairly accurate statistics relating to growth, production, amount of food consumed, an account of losses and other items relating to the cost and effectiveness of operation. Guesses and estimates have given place to actual determinations. These begin with the eggs and end with planting, each can of fish in transportation now bearing a tag which declares the species, actual weight and the calculated number of fish which it contains.

Results of the stream survey are rapidly accumulating. Information relating to areas of considerable extent is now being tabulated so as to make it easily available, and its relation to a present and future conservation and stocking policy is becoming plainly evident.

The bureau is now operating on what appears to be the most promising program when its available personnel, equipment, funds, and general knowledge of the situation are considered. However, the desire for an expressed and published policy of conservation, involving the numerous game fishes of the State is very evident. Such a policy will not be easily formulated, and it will of necessity be somewhat involved and complicated, for it must reflect some of the unrivaled diversity of natural and artificial conditions which California presents.

The recent and great extension of irrigation and power installations is resulting in marked changes in river conditions. Artificial lakes, in some cases of large size, are appearing while stream flow is being correspondingly changed. The original environment of the native game fishes is being profoundly altered while we are unaware and entirely ignorant of the probable results. It appears desirable that means be soon provided for an extended study of the situation, and so directed as to supply at least some desired information relating to what is actually transpiring.

Questions, opinions and suggestions relating to the so-called rough fish in our waters are constantly appearing. We are lacking in accurate information relating to nearly all of these forms and until something more definite is known of their life histories and ecological interrelationships, mere speculations and recommendations relating to them are futile, perhaps even harmful. Danger of their spread through the use of minnows as bait should be guarded against. A promising beginning has been made in an investigation of some native minnows, and one very creditable report lately appeared.

Investigations dealing with disease control, various diets, methods of feeding, and improved hatchery operation are progressing. In fact they have already demonstrated their actual worth. An experimental hatchery and small laboratory are available at the Mt. Shasta plant. The location is well chosen as the results of experimental work in charge of the biologist or toxicologist or both may be immediately tested under control in actual hatchery procedure. A survey of disease conditions and the general character of the water supply of the various hatcheries is being carried on.

The system of hatchery inspection now in vogue has produced good results which in some cases are very evident. It is so conducted as to be helpful to both the central office and the hatchery involved. The inspector's report is largely guided by printed sheets with numerous questions or suggestions. It is submitted in duplicate so that its information may be available to the hatcheryman directly concerned. It considers many details relating to the condition of buildings, equipment, grounds, water supply, and fish, methods of feeding, losses, evidence of disease, housing conditions, even the personal appearance of employees.

Opportunity for the personal improvement of employees is not overlooked. They may profit by the visits of inspectors and those connected with special investigations. The library is accessible through the mail, lists of available books and papers being in each hatchery. The annual school and conference, now an established affair, provides among other things for the discussion of problems of general interest. The occasional transfer of younger members of the force secures the benefits of wider experience.

At present there is ample provision for the eggs of eastern brook, Loch Leven, cutthroat and golden trout, king and silver salmon, necessary for artificial propagation. To fill the demand for rainbow trout eggs is still an unsolved problem which is rapidly growing more acute. The purchase of eggs from without the state is undesirable, and the supply from that source is insufficient and not dependable. The taking of eggs from wild sources should and eventually will cease except in cases where they may be regarded as salvage. Investigation and experimentation bearing on the problem are under way but the results, partly from lack of time, are not as yet very encouraging.

Under the recent organization the allotment and distribution of fish becomes a responsibility of this bureau. This may be regarded as entirely desirable as it will aid in the centralization of activities relating to fish conservation. Aid and cooperation with members of other bureaus and with interested sportsmen may be sought and directed to the best advantage. Marked progress has been made in a proper balance of allotments and in a careful consideration of distribution. Methods of transportation which will keep abreast with the improvement and extension of roads and automobile development are constantly considered. Minor details such as aeration and cooling systems for trucks, resting ponds at secondary centers of distribution, cooperative ageing ponds, etc., claimed attention.

Continued improvement in the general betterment of hatchery equipment including buildings, grounds, and especially housing con-

FIG. 1. Bureau of Fish Conservation Hatchery Employees. October 13, 1936.

ditions of the men employed may be reported. The adopted policy of first placing each worthwhile plant in the best possible condition for productivity before making new locations appears to be sound. As long as desirable operating costs for the hatcheries now maintained by the bureau are beyond the budget allotment, it is unwise to add to the number. This should not preclude the study of promising new locations, an extended test of such, or even the acquisition of water rights. In fact experimentation at certain partly explored sites is very desirable. Difficulties relating to the ownership of the water supply at several hatcheries have been a constant source of annoyance. These are being cleared up wherever it is possible. The necessity of making the water supply thoroughly secure before locating a hatchery seems to be at last well understood. The water supply is the most difficult thing with which our hatcheries now have to contend. In many cases its unalterable character is the determining factor in relation to growth, ageing of fish, control of losses, etc. It alone often determines the time of planting and the size of fish produced. The production of large fish, 7 or 8 inches long, as advocated by many sportsmen is absolutely impossible in many of our hatcheries, because of adverse water conditions.

The following hatcheries have been operated during the biennium: Mt. Shasta, Burney Creek, Fall Creek, Prairie Creek, Lake Almanor, Domingo Springs, Fort Seward, Cold Creek, Brookdale, Big Creek, Feather River, Yuba River, Lake Tahoe, Blackwood, Mt. Tallac, Alpine, Fern Creek, Mt. Whitney, Basin Creek, Yosemite, Kings River, Madera, Huntington Lake, Friant Bass Ponds, Kaweah, and Forest Home. These have been supported by some 27 egg taking stations. Some of these are of necessity more or less temporary, while others, especially the Klamath salmon station, are substantial and perhaps permanent institutions.

A record of production and planting is presented in the appendix by J. H. Vogt, Assistant Chief.

Salmon propagation centers at Fall Creek, some support being received from the Mt. Shasta, Prairie Creek and Big Creek hatcheries. Considerable experimentation with the introduction of silver salmon in certain inland waters has shown the possibility of using them to assist in the maintenance of trout fishing. An investigation of the life history, distribution, and other matters relating to the silver salmon is greatly needed as a direct aid in the conservation of the species in the State. The value of this salmon as a sport fish is not sufficiently appreciated.

Extensive construction and improvement have been accomplished through government relief agencies. Notable among these are new hatcheries with their accompaniment of residences, etc., which have been built at Basin Creek, Prairie Creek, and near Elk Grove. Each of these is well planned and presumably adapted to its particular function. The land holdings at Basin Creek and Elk Grove are extensive enough to deserve improvement as small parks. Lesser improvements were completed at Fall Creek, Lake Almanor, Brookdale, Kings River and Forest Home. Purchase of the latter place was completed and an overhaul of buildings, ponds and equipment is in progress.

The Cooperative Trout Investigation, the U. S. Bureau of Fisheries, the California Division of Fish and Game and Stanford Uni-

versity participating, has completed four years of active work. Some 18 published papers relating to various phases of the investigation have appeared and others are in preparation. Some recommendations, the results of careful tests, have already been accepted and put into practice. In 1934 an allotment of \$20,000 to the United States Bureau of Fisheries from the Public Works Administration permitted Dr. P. R. Needham and Mr. A. C. Taft of the cooperative investigation to make an extensive stream and lake survey in the state. The work was mostly confined to waters within the Klamath, Sequoia, Inyo and Plumas national forests. The results and recommendations embodied in reports are now available. The principal activities of the trout investigation have centered about Scott and Waddell Creeks in Santa Cruz County, at Beaver and Fall Creeks tributary to Klamath River, and at Hot Creek ponds in Owens Valley. From these points it has of necessity spread to other localities which offered particular opportunities. The stream studies have much to do with the migratory habits and other features of the life history of rainbow trout, while the work at Hot Creek concerns itself largely with selected brood stocks, the production of eggs, studies in growth, proper diets, hatchery procedure, etc.

The bureau has attempted in so far as possible to conduct its work on scientific principles and base its procedure on established facts. Suggestive and constructive criticism have been alike received and carefully considered. And finally it has attempted to maintain a spirit of friendly cooperation with sportsmen and others interested in the conservation of game fishes and the maintenance of sport fishing.

REPORT OF THE BUREAU OF GAME CONSERVATION

By J. S. HUNTER, Chief

Game conservation today involves many more problems than were dreamed of in the early days when protective laws were first adopted. In California, with a constantly increasing population and the development that naturally goes with it, it is becoming more and more difficult to keep ahead of the harvest of game and fish by the army of licensed hunters. Guess work as to supply and demand will not give the information we must have. In order to secure the information necessary, we must have the hearty cooperation of the men who hunt and fish. It is for that reason that we have requested all sportsmen to give us a record of the amount of game that they harvest each year. It is nothing more or less than the successful storekeeper does every year in taking stock. Just as this man must know what is on his shelves and what goes over the counter, we must know what is in the field and the toll that has been taken. The first year's tabulation of the kill has proven that as a game state California is in the first rank. Approximately 50 per cent of the 122,000 hunters tabulated gave the information requested. This voluntary return is very much better than the compulsory return that is required in certain eastern states. The actual amount of game reported killed during the 1934-35 season was:

Doves	580,310
Quail (all species)	560,481
Ducks	389,242
Pigeons	51,056
Geese	40,278
Pheasants	25,220
Rabbits (Cottontail and Brush)	251,891
Coyotes	14,259
Bear	447

By just what factor these figures should be multiplied to make up the actual kill of the 170,000 hunters is problematical but the real kill was certainly double the above figures.

The distribution of the game of the state is very well shown by the list of the ten leading counties in the take of the various species of game and by the composite map on page 26. One of the most surprising and interesting records obtained was as to the number of coyotes killed by hunters, viz., 14,259. This figure, as stated above, should be multiplied by two to give the approximate number. Coyotes are regarded by sheepmen and farmers generally as their worst enemies. Certainly the hunter is not an altogether undesirable individual to have roaming over the hills when he kills in his travels this vast number of destructive predators. The quail harvest would have been much larger had it not been for the fact that by regulation the southern counties were closed to hunting in 1934.

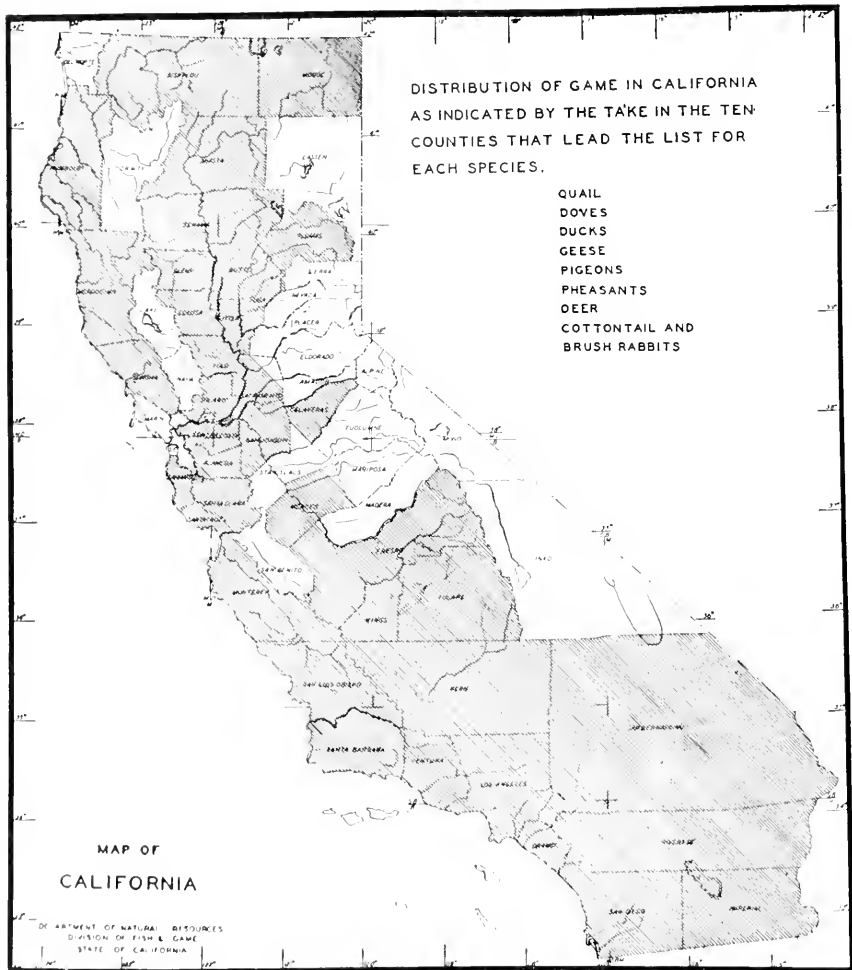

FIG. 2.

Deer hunters travel more than do any other class. Only 44 per cent of the deer taken were killed by residents of the county in which the animals were killed. Other than ducks and geese, small game hunting is done mostly in the county of residence. The percentages are as follows:

	<i>Per cent</i>
Deer	44
Waterfowl	50
Bear	56
Coyote	65
Pheasants	70
Doves	72
Rabbits (Cottontail and Brush)	73
Pigeons	75
Quail	75

The data secured the first year have been most valuable and interesting and as years go by the entire conservation program will be based on the definite information that is furnished the Division by the hunters themselves.

In past years our game farms have been limited in their production by the amount of money that could be allotted to that activity. Fortunately, we were able to increase the allotment for the 88th fiscal year by nearly one-third and for the 89th and 90th fiscal years the amount will be practically double that of the previous biennium. We have now definitely established the ringneck pheasant as a game bird in California. In certain parts of the State the species is abundant enough to stand a longer open season or larger bag limit. In the south where our activities have been concerned more with quail, very encouraging results have been obtained. The production of the game farms has been satisfactory and the increase on our quail refuge areas has been remarkable. Greater attention will be given in the future to the raising of Chukar partridges, as we believe that this species will fit in most excellently in parts of our State that are almost gameless at the present time.

The deer situation, generally, is satisfactory. There has been some apprehension as to the effect of the repeal of the forked horn mule deer law on this species particularly in the northeastern part of the state. It was believed at the time the law was amended at the last session of the legislature that it would do away with the practice of some hunters killing forked horns, leaving them where killed and later killing a larger animal. Whether this repeal has had a serious effect on the deer of that section can not be determined until the end of the 1936 season. If it is found that the present law has not worked out satisfactorily, a recommendation will be made for its repeal.

It is interesting to note that in the recent estimate of the U. S. Forest Service of the deer population of the western national forests, that in California there are nine deer per square mile and in all other western national forests the average is only three and one-half deer per square mile. California has in excess of 20 per cent of all the deer of the national forests of the country.

Predatory animal control has been carried on actively on refuge and adjoining areas. Four expert trappers with assistants have been working constantly in the north and three trappers in the south. In addition, four lion hunters have been actively engaged in lion control. Wherever possible these men have been equipped with state owned pickup trucks in order that they may be better able to cover the territory assigned to them. The kill of lions for the two calendar years of 1934 and 1935 was 470, making a grand total of 7460 that have been destroyed since 1907.

Waterfowl conditions from the hunter's point of view have not been satisfactory. It is certain, however, that conditions would have been much worse had it not been for the work done by the Division in providing refuges for the birds in the duck centers of the State. Previous to the establishment of these areas there was practically no place where birds were safe from the opening of the season to its close. Every body of water in the areas frequented by waterfowl was heavily shot over and the birds were constantly disturbed and driven out of the State. It was therefore apparent that areas of safety must be provided

and the Division did just that. There is no doubt in the mind of the writer that at the close of the duck season there were not less than two million birds on our refuges—breeding stock for the next year. Continual work is necessary on waterfowl refuges in order that satisfactory conditions may be provided to take care of the enormous number of birds that crowd in. That the birds are well aware of the boundaries of the protected areas is apparent. When flocks are noted they seem to know when they cross the fence line and quickly settle with their fellows on the open water. California was one of the first states to provide such areas.

GAME FARMS

Production and distribution from our two game farms has been increased very materially in the past two years. The chief factor in this added increase is the further development of the holding pen program. From a small beginning in 1931, when 16 pens were built at Cotati in Sonoma County, this program has developed year by year until at the present time we are serving about 800 of these pens. In 1932 Bakersfield built the second unit of pens in the state. This unit consisted of 20 pens. To show more definitely just what this program means the Bakersfield project will serve as a typical example. Before these pens were built, we were never able to get more than 250 birds liberated in Kern County in any one season. The first season the pens were operated 749 birds were released. The second year saw 1184 birds released and the next season this number was increased to 1876.

These pens are constructed according to plans and specifications furnished by the game farms and paid for by the local sportsmen's organization. A caretaker for the project is also furnished by the local group. The feeding program is carried out under the supervision of the game farms so that the birds after leaving the farms have the same type of feed that they had at the farms. Birds for these groups of holding pens are hatched and brooded at the farms until they are old enough to get along without artificial heat. At that time they are taken by truck or train to the several holding pen units where they are kept until old enough to be released into "closed areas." The average time of this brooding period is about 30 days, and the average time that the birds spend in the holding pen, before being released, is about 40 days. At that time the birds are old enough to make their own way and take care of themselves in the open.

It is not logical to suppose that birds may be reared on our game farms and released for immediate shooting. A program of that sort would not do and would fall of its own weight. Artificially reared birds should be released into "closed areas" where they are protected and allowed to increase according to their own inclinations. When these closed areas are stocked sufficiently, the overflow will provide ample shooting for the hunters in adjoining territory and the supply of game will be uniform each year.

The general program, then, of our game farms is artificially produced birds, reared in holding pens, and released into closed areas for further increase and stocking of the adjoining territory. This program has enabled the game farms to turn out more and better birds at

reduced costs. And while this is important, there is another angle to the program that is of equal or more importance. It has been found that in localities where these pens are located game law violations are decreasing. It seems that where a community has invested its money in holding pens, and taken care of the birds, the idea of state ownership is lost. The birds become community property and are treated as such. Many communities are accepting this responsibility. The presence of the birds seems to help to crystallize public sentiment in their favor and the poacher is gradually finding it harder to get away with his nefarious business.

Near the close of 1935 the Division of Fish and Game launched a WPA building program that has given units of 48 pens to Redding, Willows, Sacramento, Stockton and Fresno. Each of these units of pens has a seasonal capacity of 2000 birds. At the same time the incubating and brooding facilities have been increased to keep up with this holding pen expansion program. As the program develops production facilities will be increased as needed.

The production of our game farms is confined to five major birds: Ringneck, Mongolian and Reeves Pheasants; Valley Quail, Chukor Partridge and some work with the Mexican Bronze Turkey. A careful survey of the conditions of the state warrants this sort of a program. The ringneck pheasant is produced for the agricultural districts; the Mongolian pheasant for the more wooded sections; the Reeves pheasant for the elevations above 2000 feet; the Chukor partridge is adapted to the arid sections of the state. Beginning with the 1937 season, the annual production of Mongolian pheasants will be progressively increased. Most of the available agricultural areas of the state have been well stocked with ringnecks and more attention will now be paid to the wooded foothill areas. The Mexican bronze turkey is finding a suitable home in many sections of the state, where food conditions are almost identical with its native habitat in Old Mexico, New Mexico, Arizona and parts of Colorado.

With the development of a program of this sort the operations of the hunter will be spread out and congestion eliminated and the possible daily bag increased to several types of birds instead of one or two.

In the past two years the production of quail and pheasants has been about equal while the experimental work on the Chukor Partridge has been going ahead. With the planting of 3500 of these birds in about 65 different sections of the State, the results seem to justify our confidence in the bird and we believe this fine game bird will provide the answer to the stocking of the arid sections where at the present time there are no birds of any kind. The open seasons for the past few years have seen the pheasant as a game bird come into high favor among sportsmen. More localities are asking for the planting of this bird.

The following table shows the egg production and general distribution of birds for the biennium:

Eggs Laid					
<i>Ringneck Pheasant</i>	<i>Silver and Golden</i>	<i>Reeves</i>	<i>Partridge</i>	<i>Quail</i>	<i>Turkey</i>
106,650	176	3,373	12,285	63,245	453

Eggs Distributed					
<i>Ringneck Pheasant</i>	<i>Silver and Golden</i>	<i>Reeves</i>	<i>Partridge</i>	<i>Quail</i>	<i>Turkey</i>
17,429	49	204	94	9,789	—
Birds Distributed					
<i>Ringneck Pheasant</i>	<i>Silver and Golden</i>	<i>Reeves</i>	<i>Partridge</i>	<i>Quail</i>	<i>Turkey</i>
38,661	22	482	2,391	22,867	150

THE QUAIL REFUGE PROGRAM

In 1932 the Division of Fish and Game launched a quail restoration program in southern California based on the premise that through managed natural production the California valley quail could be returned to many of the areas in the southern part of the state where it was once considerably more abundant than it is at the present time.

The first step in the development of this quail management project was the establishment of thirty-six quail refuge areas in the counties of Los Angeles, San Bernardino, Riverside and San Diego. These refuges were then divided into three groups and each group was placed under the dominion of a trained refuge caretaker whose duties included those of warden, trapper and game management expert. Thus the ground work was laid for production of valley quail in those field laboratories—the quail refuges.

In outlining a management plan, the first thing that was considered was, of course, the protection of game from the human element—the man with the gun. This was taken care of by the more than adequate posting of the refuge areas against trespass and, as aforesaid, by the employment of caretakers to prevent violations of the sanctuaries under their supervision. These men have also been responsible for carrying on predatory animal control work on the refuges and have been waging continual warfare against the furred and feathered enemies of game species since the quail replenishment program met its inception four years ago.

The protection of the quail from human and other predators has not been the deciding factor in the success of the quail refuge venture, although it has certainly played its part. Briefly, the answer to the quail problem in southern California has been found to lie in the maintenance of a dependable game water supply during the summer months. Throughout a large part of the desert and semidesert areas of the state most of the water that was once available to wild game has either dried up due to a succession of years of low precipitation, or has been appropriated for other uses by man. Thousands of springs that once provided game with water throughout the year have ceased to flow, and this has spelled game depletion. It was the water problem that had to be solved on the quail refuges in order to bring them to the point at which we find them today, with by far the majority of them supporting quail populations approaching the maximum.

The development of water on the quail refuges was approached from two angles; first, the development of natural water and, second, the supplementing of natural water by entirely artificial means. In the first instance, springs and seepages that ordinarily dried up early in the summer were cleaned out, walled up and provided with drip

pipes in such a manner that they became dependable all-year water sources. In providing entirely artificial watering places, fifty gallon galvanized steel barrels provided with automatically fed drinking troughs have proven very satisfactory. The first of these units was developed and installed by Mr. James Moffit, then in charge of the quail refuge program. Since that time some changes have been made in its mechanics but the system remains the same in principle. Prior to the present year the water barrels have only been used to supplement natural water, the mechanical devices always having been placed where a natural supply has been available within a reasonable distance. However, during the present extremely dry summer of 1936, even the most dependable of natural sources have failed, and on many of the refuges water barrels have been relied on entirely. Without their aid, thousands of quail would have perished of thirst—a heartbreaking conclusion to four years of quail refuge building.

Actually, when we consider the size of the waterless areas of the south, we realize that this business of supplying water to game artificially has been carried on only on a very small scale. It is mentioned here to emphasize the importance of considering water supply when we speak of game management in California. Throughout a large part of our state, we can not speak of one without including the other. The possibilities of a constructive water development program, the results to be measured in terms of game production, are limitless. The quail refuge program has been responsible for demonstrating these possibilities.

The southern California quail problem has, as has been shown above, been a successful project and has been productive of much valuable information, but it has not been the only notable piece of upland game bird work accomplished during the present biennium. In San Mateo County, E. L. Sumner, Jr., then an employee of the Division, completed two years of concentrated study of the life history and habits of the California Valley Quail. The Division has published this year a very complete account of his researches entitled, "A Life History Study of the California Quail, With Recommendations for Conservation and Management." Mr. Sumner's work is considered to be a real contribution to game management literature.

PREDATORY ANIMAL CONTROL

The control of coyotes and bobcats in game refuges and in other regions of game concentration has continued in the usual areas, with additional areas requiring the attention of the trappers from time to time. The killing of deer by coyotes, even in winter, is a local condition. It is apparently not governed by the number of coyotes or deer but by a lack of abundance of the coyotes' normal food supply such as rabbits, squirrels and other small rodents. Such local areas have been found in Lassen and Shasta counties, El Dorado, Placer and Tulare counties.

The four men working in northern California have taken 778 coyotes and 150 bobcats or a total of 928 during the biennium. The animals have been trapped in relatively small concentration areas and on refuges where damage was being done to game and domestic stock. The catch by counties was as follows:

	<i>Coyotes</i>	<i>Bobcats</i>
Lassen -----	410	11
Ventura -----	97	33
San Benito -----	72	34
Shasta -----	64	24
Tulare -----	31	9
Placer -----	28	2
Modoc -----	24	--
Monterey -----	21	11
El Dorado -----	14	5
Merced -----	5	--
San Mateo -----	4	16
Siskiyou -----	4	--
Mariposa -----	3	5
Kern -----	1	--
	778	150

Sixty thousand miles of trapline were run, the catch averaging one animal to each 64.5 miles of trapline. Seventy-six thousand five hundred and sixty day-sets were made, or 82.5 per animal. The cost of trapping coyotes and bobcats was \$11.64 per animal, or in time, 3.14 days. One bobcat was taken for every 400 miles of trapline and one coyote for every 77.11 miles of trapline. Most of the coyotes, except in San Benito County, were taken at elevations between 3000 and 6000 feet. Practically all of the bobcats were caught below the 5000 foot level. In the experience of the trappers the area covered by a resident coyote is considerably smaller than is commonly supposed. It is generally a circuit covered at intervals of several days, covering each day an area of about five square miles. A female coyote, during the whelping time, ranges over a much smaller area.

Eight additional trappers have been put on predatory animal work under the supervision of the experienced trappers who have been employed for several years. To facilitate administration, the State has been divided into five districts with a supervising trapper in charge of each. The districts are as follows:

- Northeastern California district from the Sacramento-Truckee Highway north to the Oregon line and west to the Sacramento river and Highway 99.
- Northwestern California district from San Francisco Bay north to the Oregon line and east to the Sacramento river and Highway 99.
- South Sierra district from Sacramento-Truckee Highway south to Grapevine on Ridge Route and west to San Joaquin river.
- South Coast district from San Francisco Bay south to and including Ventura County and east to Grapevine on Ridge Route and San Joaquin river.
- Southern California district, all of the southern part of the state from Tehachapi Mountains and Ventura County south to Mexican line.

DEER STUDIES

A study of the Rocky Mountain mule deer of northeastern California has been carried on continuously for the past several years. This study includes actual census work and is furnishing the Division with definite information as to the number, sex ratio, and condition of the deer herd and of disease outbreaks and range conditions. A large portion of the definite knowledge which we have of the mule deer has come as a result of this study.

During the last two years, fifteen count areas on the winter range of the mule deer have been mapped out and counts have been made

three times during the winter months. In this way about 500 square miles or approximately 16 per cent of the winter range of the Rocky Mountain Mule Deer in northeastern California were carefully censused. The average total of the three counts has been 9000 head, the figure on which is based our estimate of nearly 100,000 head of mule deer in the herds of Lassen, Modoc, Siskiyou, Shasta and Plumas counties. This figure we believe is conservative. The sex ratio has averaged one buck with forked horns or better to 6.27 does and fawns. This compares favorably with Dixon's ratio of 5.33 in six counts made in Yosemite and Sequoia National Parks where there is no hunting whatsoever.

The range situation has been particularly bad on the public domain of Lassen and Modoc counties, which has been overstocked with sheep. This area, however, is now being administered by the U. S. Department of Interior, Division of Grazing, and we hope that the tremendous concentration of sheep on small areas will be eliminated. Some of the over-grazed areas are past redemption now, but the rest can, by reasonable range management practices, be saved. In portions of Modoc and Lassen counties, deer have done a considerable amount of damage to their own winter range; this is particularly true in the Blue Mountain area of Modoc County and on the winter range west of Doyle in southern Lassen County. In eastern Butte and Tehama counties between Chico Creek and Battle Creek, the Columbian Black-tailed deer have almost destroyed their winter range in many places. The condition was brought on by over-grazing by sheep and cattle and was of course aggravated by the large number of deer which annually move westward out of the Lassen Park, Upper Battle Creek and Lake Almanor areas. This migration is one of the largest in the state.

Six head of white-tailed deer were seen in the Burney Falls State Park on the shores of the Pacific Gas & Electric Company's reservoir known as Lake Britton. There were four does and two fawns. A buck of this species became entangled in a wire fence near the town of Burney and was released.

SAGE HENS

The sage hen condition in the northeastern sagebrush plateau region is far from being satisfactory. Locally, in Modoc County, they have increased rapidly but in the sheep grazing areas of both counties, particularly in Lassen, they have gone down hill due to the fact that the sheep are brought in over the breeding grounds when the nesting season is in full swing. This condition must be remedied in Lassen County or the sage hen is going to be a thing of the past on range where at one time it was probably more abundant than anywhere else in the State.

ANTELOPE

Antelope have increased and spread to territory in which they have not been seen for many years. It is our belief that no less than 16,000 head regularly range in California and additional ones winter in California and summer in Nevada. Approximately 15,000 head wintered along the eastern side of Refuge 1Q in eastern Lassen County during the winter of 1935-1936. In the summer these animals scatter

in various directions, mostly to the northwest, and are found in small groups in practically all of the valleys in Modoc and Lassen counties. The fawn crop of 1935 was exceptional, but that of 1936 was not quite as good for some reason. Antelope have been studied regularly on two types of areas; one, a block area on which they are counted and studied each month and the other a strip area where counts are made four times a year.

REPORT OF THE BUREAU OF PATROL

By E. L. MACAULEY, Chief

In July, 1935, patrol activities of this bureau were reorganized and the state divided into three districts. The Coast District includes the counties of Del Norte, Humboldt, Mendocino, Sonoma, Lake, Napa and Marin in the northern division, and the counties of San Francisco, Contra Costa, Alameda, Santa Clara, San Benito, Monterey, San Mateo, Santa Cruz and San Luis Obispo in the southern division. The Central District was divided in two divisions, the northern division including the counties of Siskiyou, Modoc, Trinity, Shasta, Lassen, Tehama, Plumas, Glenn, Butte, Sierra, Nevada, Colusa, Sutter, Yuba, Placer, El Dorado, Yolo, Solano and Sacramento, and the southern division including the counties of Alpine, Amador, San Joaquin, Calaveras, Tuolumne, Mariposa, Merced, Stanislaus, Madera, Fresno, Tulare, Kings and Kern. The Southern District comprising the balance of the State was divided in two divisions, the western division including the counties of Santa Barbara, Ventura, Los Angeles, Orange and San Diego, and the eastern division including Mono, San Bernardino, Riverside, Imperial and Inyo counties.

Each district is in charge of an inspector who has under him two captains, one for each division. It is contemplated that a new grade of sergeant will be established who will work under the captains. A new grade of assistant fish and game warden was created, examinations for which will be open to the general public. After appointment, the assistant warden will serve an apprenticeship in the various bureaus of the division, thoroughly learning the scope of the work, and in all probability will decide the branch of the work for which he is best suited. After a fixed period of service as an assistant warden, promotion can be obtained by taking examinations for the next higher grade, fish and game warden.

Belts, shoulder and lapel insignia have been added to our patrol uniforms, and a new type of service hat specified. Our marine patrol wears navy blue instead of forest green and caps in lieu of hats.

This reorganization of districts and patrol activities has resulted in increased efficiency as indicated in the recapitulation of arrests and convictions which will be found in the appendix on page 74. In addition, the average fine imposed shows a slight increase which may be taken as a measure that times are getting better and that the courts feel larger fines are justified.

During the past biennium the following members of this department retired from active service: Captain C. F. Maddox, Captain S. J. Carpenter; Wardens J. L. Bundoek, C. F. England, L. W. Longeway. K. J. Randsell passed away on November 21, 1935.

Two new seagoing patrol boats were constructed in the shipyards of Fellows & Stewart at Wilmington. The *Quinnat III* is a replacement for the old *Quinnat* which served many years on San Francisco Bay

FIG. 3. The New Patrol Boats.

FIG. 4. Fish and Game Patrol Force.

and which has been sold, as its further operation would prove uneconomical. The *Broadbill* is stationed at Newport and an additional vessel is under construction which will also be assigned to Southern California waters. A new Diesel engine has been installed in the launch *Albacore* but within the next few years it will be necessary to replace this vessel, as it has been in service almost twenty years, and we do not believe that extensive repairs will be justified in view of the age of the boat as well as the extremely hard working conditions under which she has operated. Extensive repairs have been made to the motor vessel *Bluefin* which has given very satisfactory service.

The closed cab pickups mentioned in the last biennial report have not worked out as well as expected, and are being replaced as rapidly as the budget will permit with standard passenger cars. While the pickups are very satisfactory for fish planting purposes, and travel well under a heavy load, they do not perform in a satisfactory manner empty. Since fish planting activities have been transferred to the Bureau of Fish Conservation, there is no longer any necessity for cargo-carrying vehicles in this department and it is hoped that the change-over to more suitable cars for patrol work will be completed within the next few months.

Conferences with wardens were held in Sacramento in February, 1935, and in April, 1936, where all of our field men throughout the State met together at one time to exchange their experiences in fish and game law enforcement work. Pistol shoots were held on each occasion at Roseville on the range furnished through the courtesy of the Roseville County Council.

REPORT OF THE BUREAU OF COMMERCIAL FISHERIES

By N. B. SCOFIELD, Chief

The commercial fisheries constitute one of the State's major industries, giving employment to 15,000 persons and producing annually products valued in excess of \$30,000,000. In each of the years 1934 and 1935 the landings of fish and shellfish in California by California fishermen exceeded the billion-pound mark for the first time in the history of the State. In each of these years the total amount of fish landed and the value of the fishery products exceeded that of Alaska or any one of the states. According to the U. S. Bureau of Fisheries reports, the total value of canned fishery products and byproducts in the United States and Alaska in 1935 was \$104,480,000. The three western states and Alaska accounted for 71 per cent of this total. California, with her important tuna, sardine and mackerel canning industry, was first in value of canned fishery products and byproducts, amounting to \$35,797,000, or 34 per cent of the total. Alaska was second with 27 per cent of the total value. This would leave 10 per cent of the total value to be divided between Oregon and Washington.

FIG. 5. Total landings of fish (exclusive of mollusks and crustaceans) in California. Importations from Japan and Hawaii have been omitted. Catches south of the international boundary have been included. "Other fish" consists of the combined species of fish except sardines. The top of the black bar represents the total of our so-called local catch.

As has been stated in former reports, the production of the fisheries as a whole follows very closely the prosperity curve. When the

country is prosperous the fishery production rises, and when a depression comes the fisheries drop to a lower level. In our last report we pointed out the rising production of the fisheries during the years 1932 and 1933 after the low year of 1931. The tremendous increase in the production of the fisheries during 1934 and 1935 (See Fig. 5) can not all be credited to returning prosperity, however, for we cer-

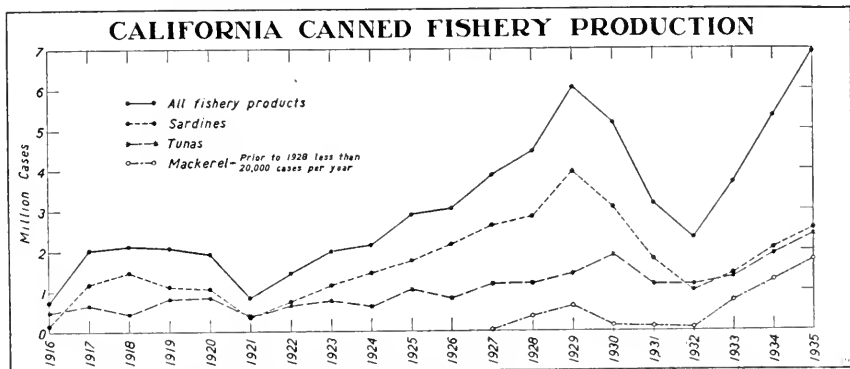

FIG. 6. California canned fishery production, 1916 to 1935, inclusive.

tainly were not as prosperous during the past two years as we were in 1928 or 1929, although the fisheries produced two hundred million pounds more fish in either of the past two years than in the former record year of 1929. There are two main causes for the increase. One is the virtual removal, by the Division, of restrictions against the use of sardines for the manufacture of oil and meal; and the other is the strong domestic market for canned fish, which is, no doubt, being used in part as a substitute for more expensive meats. The increased demand for fish as a food is not a temporary thing but bids fair to be permanent.

Although this report is for the biennial period extending from July 1, 1934, to June 30, 1936, we have been accustomed to compiling the commercial fish catch and fish pack by calendar years. The sardine season fits best into the fiscal year; therefore, besides compiling the sardine statistics by calendar years along with the rest of the fisheries, we also treat them in a special seasonal report. This procedure is followed in this report and care should be used not to confuse sardine figures given for calendar years with those for seasons. The detailed record of the fish catch and fish pack for the calendar years of 1934 and 1935 and the special sardine report for the seasons 1934-1935 and 1935-1936 may be found in the appendix to this report, or in statistical Circular No. 9, issued in May, 1935, and Circular No. 10 issued in May, 1936.

In 1934, the total landings of fish and shellfish in California by California fishermen amounted to 1,167,419,462 pounds. In 1935, the total landings were 1,172,539,562 pounds. The combined landings for the two years amounted to 2,339,959,024 pounds as compared with landings of 1,140,668,653 pounds for the two years 1932 and 1933, or an increase of 105 per cent.

In 1934, the fisheries produced 5,324,084 cases of canned products, and 6,922,025 cases in 1935, making a total of 12,246,109 cases for the two-year period, as compared with 6,021,345 cases for the previous two-year period, or an increase of over 100 per cent.

Fish meal produced in 1934 from sardines and other fish amounted to 77,724 tons. In 1935 this product amounted to 78,695 tons.

Fish oil produced from sardines and other fish in 1934 amounted to 16,128,208 gallons. In 1935 the oil produced was 13,924,138 gallons. The fish meal and oil produced during the two years covered by this report was considerably more than double that produced during the previous two years. These records do not include the production of the floating sardine reduction plants operating just outside the three-mile limit to escape the conservation regulations of the State. A report of their operations is given elsewhere.

The value of the canned, cured and manufactured fishery products for 1934, not including fish sold fresh in the markets or the floating sardine plant products, was \$24,847,256 and 6,570 persons were employed in the shore packing plants. In 1935 the value of these same products was \$30,920,240, and 8,168 persons were employed in the shore packing plants.

Market fishermen's licenses issued in the license year 1934-1935 (April 1 to March 31) totaled 5323, while for the license year 1935-1936, 6007 licenses were issued.

SARDINES

The sardine fishery continues to be the largest in the State. By referring to Fig. 5 it will be seen that the sardine catch overshadows that of all other species combined and accounts for most of the gain in the total take of fish in the past several years. During the past 20 years the annual sardine catch, including that of the floating plants, has doubled, on the average, each 4 or 5 years. The amount of sardines delivered to shore and floating plants on the California coast during the past two sardine seasons was 608,936 and 565,920 tons, respectively.

Sardine Season 1934-35 (Shore Plants)

Amount of catch, 961,192,000 lbs.	--- Increase over previous season	53%
Pack of pound oval cans, 1,186,313 cases	Decline from previous season	less than 1%
Pack of other size cans, 381,929 cases	----- Decline from previous season	15%
Sardine meal, 77,951 tons	----- Increase over previous season	64%
Sardine oil, 16,870,565 gallons	--- Increase over previous season	82%

Sardine Season 1935-36 (Shore Plants)

Amount of catch, 811,332,000 lbs.	Decline from previous season	15%
Pack of pound oval cans, 1,936,151 cases	----- Increase over previous season	30%
Pack of other size cans, 1,205,342 cases	----- Increase over previous season	215%
Sardine meal, 59,904 tons	----- Decline from previous season	29%
Sardine oil, 13,200,692 gallons	----- Decline from previous season	28%

In the above tables, giving the sardine catch and production of shore plants for the past two seasons, there are several things which deserve comment. The great increase in the catch and in the yield of sardine oil and meal in the season 1934-1935 was the result of very liberal reduction permits granted to reduction plants by the Division

of Fish and Game. The price of oil was good and the reduction operations were quite profitable. Under the law canners may take sardines without limit provided they produce the equivalent of $13\frac{1}{2}$ cases of pound oval cans from each ton of fish, but it is unlawful to use sardines for reduction except under permit. The law limits the amount of the permits to what will not tend to deplete the species. Permits were issued for the season 1934-1935 to aid the sardine canners to tide over the depression in the sardine canning industry and to give employment to fishermen, many of whom were in dire want. Our recommendation was that reduction permits be issued in amount not to exceed 5000 tons for each plant for the season. Under the circumstances it seemed proper to issue liberal permits, even if it resulted in a serious strain on the sardine supply. Permits were issued from time to time during the season until at the end of the season most of the plants had received 12,000 tons, an amount far in excess of what the commissioners had expected to give earlier in the season. These liberal permits not only gave relief to canners and fishermen but stimulated still further the expansion of an industry already over-capitalized. More reduction plants were built to be in readiness for the next season. During the season additional fishing boats were added to the fleets and the number of fishermen was increased by several hundred, many of them coming in with boats purchased or chartered outside the State. Canning was neglected except by a few of the wiser canners, resulting in a pack which was slightly less than in the previous poor season, although there was a brisk demand for canned sardines toward the end of the season.

For the season 1935-1936 reduction permits were issued but they were for less than half the amount given each plant during the previous season. There was a number of additional plants which got permits but the total tonnage of the permits granted was considerably less than for the season before. This resulted in a decline of 15 per cent in the total catch of sardines as compared with the season before, notwithstanding quite an increased tonnage was taken for canning. The market for canned sardines was strong throughout the season and resulted in a greatly increased pack. Most of the increase was for other sizes than pound oval cans.

The total pack of over three million cases was mostly sold in this country instead of 80 per cent of it going to foreign countries as was the case a few years ago. This change has been aided by the increased demand for all kinds of canned fish in the United States. It looks now as though the California sardine canners have at last gained the domestic market for their product, a thing which they have desired for many years. With this prospect of a good domestic market for canned sardines, canners are beginning to fear that excessive use of sardines for reduction purposes will deplete the supply of fish to such an extent that the canning industry, with its large investments in plants and boats, will be jeopardized.

In our last biennial report we commented on what we considered the enormous sardine catch for the season 1933-1934, which was, for shore and floating plants, a little over 190,000 tons. The amount of sardines delivered to shore and floating plants the past two seasons has greatly exceeded that huge amount, the shore and floating plants on

the California coast taking 608,936 tons in the 1934-1935 season and 565,920 tons in the season of 1935-1936.

Even if there were no evidences of depletion disclosed by the research of the State Fisheries Laboratory, it must be evident to any who are interested in guarding this valuable State resource from over-exploitation that this expansion should be halted. When the maximum safe production of the fishery is passed, if it has not already passed that limit, the ensuing collapse of the fishery means disaster to fishermen and plant owners and to their huge investment in boats and plant equipment.

A few comparisons will aid in appreciating the great strain which is being exerted on this natural resource. The California sardine catch in either of the past two seasons was much greater than the seasonal or annual catch of any species of fish has ever been in North America. Alaska is famous for its great fisheries, but the sardine catch alone of California now exceeds the catch of all species of fish and shellfish in Alaska. How long will our sardine fishery stand this strain? On our Atlantic coast where the wide continental shelf is capable of supporting a larger fish population than the very narrow continental shelf of our Pacific coast, the menhaden fishery, which is in many ways comparable to our sardine fishery, reached its limit of production at 407,000 tons in the year 1922. Thereafter the menhaden fishery, in the face of better prices for meal and oil and with more economical fishing and manufacturing methods, has declined to less than one-half its maximum production of 15 years ago.

The mackerel of the Atlantic coast, which also is a schooling, pelagic fish, like the sardine, has had a similar history. Its maximum production by American vessels was in 1884 when 65,000 tons were taken. In 1885 the catch dropped to 45,000 tons and since that year has not exceeded 25,000 tons. This also appears to be a fishery which has been over-exploited.

Those who prefer to believe that our sardine fishery is not in danger point to the sardine fishery of Japan which produced in 1934, the last figures available, 1,617,535 tons. In making this comparison, a number of things should be taken into account. The Japanese fishery has only recently been exploited to such an extent, and there is no assurance that their resource can stand this heavy fishing for long. In California the fishery depends on one species of fish, while in Japan there are five species of fish included in the figures for the sardine fishery. They are a true sardine, three species of herringlike fishes and one species of anchovy.

In comparing the yield of the California sardine fishery with that of Japan the fishing areas of the two countries which are suitable to maintain sardine populations should be compared. The world's larger fisheries are confined to relatively shallow water for it is only in such waters that fish can find an adequate food supply. For practical purposes the fishing area can be considered to lie within the 100-fathom line. The area within the 100-fathom line in Japanese waters is 443,000 square statute miles. The area within the 100-fathom line along the Pacific coast of the United States and British Columbia is 33,000 square statute miles, whereas the 100-fathom area along the coast of California alone is only 11,000 square miles. If we compare the amount of sardines

taken per square mile of area suitable for sardines in the two countries we find that the catch in California is much greater than that of Japan. If a like comparison is made with the great herring fisheries of the North Sea or with the menhaden or mackerel fisheries of the Atlantic coast of the United States, it is found that the California sardine is being fished far more intensively.

Many fisheries have been depleted by far less intensive fishing than we are giving the California sardine and we are justified in stating that the situation is critical and that the sardine resource of California is in grave danger from an industry which is still expanding at a terrific rate and over which the Division of Fish and Game has not been given adequate control.

Floating Reduction Plants

During the sardine season of 1934-1935 three floating reduction ships operated on the California coast just outside the jurisdiction of the state. These ships were supplied with sardines mostly by California fishermen who used the state harbors, and the ships delivered their products to California ports. From the products landed an estimate, which is quite accurate, has been made of the amount of sardines delivered to each plant. During the season the *Lake Miraflores* received approximately 56,646 tons of sardines and produced 9441 tons of meal and 1,936,533 gallons of oil. The *Lansing* received about 62,862 tons of sardines and produced 10,477 tons of meal and 2,201,333 gallons of oil. The *Santa Inez* received approximately 8682 tons of sardines and produced 988 tons of meal and 226,667 gallons of oil. The three plants took for the season a total of approximately 128,190 tons of sardines.

During the sardine season of 1935-1936, in addition to the three plants mentioned, a fourth plant, the *Brookdale*, operated. During this season the *Lake Miraflores* took approximately 55,638 tons of sardines and produced 9273 tons of meal and 2,253,018 gallons of oil. The *Lansing* received about 72,714 tons of sardines and produced 12,119 tons of meal and 2,665,664 gallons of oil. The *Santa Inez* received about 22,926 tons of sardines and produced 3820 tons of meal and 992,798 gallons of oil. The *Brookdale* received about 7476 tons of sardines and produced 1246 tons of meal and 185,066 gallons of oil. The four plants took during the season approximately 158,754 tons of sardines.

Conservation of Sardines

Although the take of sardines by floating reduction plants is as yet considerably less than that of the shore plants, their operation is a distinct menace to the entire industry.

Almost 20 years ago when the sardine industry was just getting started, it was recognized by the State and by sardine canners that the sardine supply had a limit and should be guarded against exploitation for reduction purposes and conserved for the higher use as human food. Laws were passed to carry out this policy and many decisions in our state courts recognize the justice and wisdom of curtailing the use of these fish in reduction plants.

There has been a 20-year fight in our legislature to prevent the reductionists from destroying this supply of food fish for a few years of quick profit. Then about six years ago was developed the floating

reduction plant, designed expressly to evade the State's laws, by operating without any restriction just outside the State's jurisdiction, where they take the fish from the same supply as the shore plants. They use the State's harbor facilities for landing their products and for refuge. The fishermen employed by them use our harbors to which they return after each night's fishing. It is even impossible to prevent them from making their catches inside the state waters.

Recognizing the injustice of the laws which prohibited the plants which operated under state jurisdiction from taking sardines for reduction purposes, while the floating reduction plants could operate without limit on sardines taken from the same schools on which the shore plants depended, the legislature gave the Division of Fish and Game authority to permit shore plants to take sardines for reduction.

This was not a solution of the problem for, if unlimited permits are given to shore plants to take sardines for reduction, it is quite evident the sardine supply will be soon exhausted. On the other hand, to limit the reduction operations of shore plants in an attempt to save the sardine supply from eventual destruction simply increases the number of floating plants and the rapid expansion of the reduction industry is not stopped. These offshore floating plants are now rapidly increasing in numbers and capacity. More fishermen are engaging in the business; more and larger boats are being added to the fishing fleet, thus still further expanding a fishery already greatly over-capitalized. In other words, there is no adequate control over this great industry and a very valuable state resource is headed for destruction.

It is obvious that the only solution to the problem is to bring the floating plants under the same rules and regulations as the shore plants. The better way to bring this about would be for the state, through legislation, to control sardine fishermen and sardine fishing boats which must make use of state waters and harbors; but so far attempts to get such legislation have been defeated by the floating plant interests. An attempt to get similar legislation in the last congress was defeated by the same interests.

MACKEREL

Mackerel canning began in California 20 years ago but the industry was unimportant prior to the year 1928. (See Fig. 6.) The efforts of canners to build up a market for canned mackerel were finally rewarded and 387,000 cases were disposed of in 1928. In 1929, the year before the financial depression, the mackerel pack was 611,000 cases. The amount of mackerel used that year for canning and in the fresh fish markets was about 60,000,000 pounds. For three years thereafter, during the first part of the depression, the take of mackerel was quite small again. The year 1933 saw a sudden revival of the industry, with a catch of almost 70,000,000 pounds, exceeding the peak year of 1929 by 10,000,000 pounds. The size of this catch is better appreciated when compared with the mackerel catch on the Atlantic coast of the United States which has not equaled 50,000,000 pounds in over 20 years.

To meet the canned mackerel demand, practically all of the southern California, and part of the Monterey, fish canners took up mackerel canning in earnest. Very little change was necessary to equip the large tuna and sardine canneries for handling mackerel as a side line. The

large fleet of sardine fishing boats was prepared to fish mackerel without alteration of fishing gear. The mackerel season fits very well into the closed season for sardines. These are the reasons why it has been possible to so quickly develop a major fishery in an attempt to satisfy the demand for canned mackerel. The result of all this was a total take of mackerel in 1934 of 113,785,000 pounds and a take of 146,427,000 pounds in 1935.

California's mackerel fishery is remarkable both for its size and the rapidity of its development. In size its yield is now three times that of the Atlantic coast of the United States. It is considerably larger than the mackerel fishery of England, Scotland and Ireland or of France. It is exceeded only slightly by that of Japan. We are naturally afraid that this very large catch is more than the California mackerel supply can stand without serious depletion.

An intensive study of this fishery was begun a few years ago when it became evident the supply of fish was to be more heavily drawn upon. The main features of the mackerel's life history have been learned but the time which has elapsed since the fishery was subjected to a heavy strain has been too short to give us the desired information as to how much the fishery can stand. It would seem wise, however, for the legislature to give the Fish and Game Commission power to regulate or limit the catch, in order that a reasonable annual catch can be tried out and thus determine what the maximum production of the fishery should be without depletion of the supply.

OYSTERS

Over 60 years ago enterprising citizens of California started an oyster-growing industry in the state by shipping oyster seed from the Atlantic coast. The young oysters grew rapidly in San Francisco and Tomales bays and the industry centered in these two bays became profitable. The summer temperatures of the water in California were too low to permit the oysters to spawn successfully, so the supply was kept up by annual importations of seed. All went well until about 20 years ago when gradually the oyster seed failed to grow properly and the older oysters became thin and watery as though their food supply was failing them. The exact cause of this decline was not determined as the industry lacked a technically trained adviser, so the growing of Eastern oysters was gradually abandoned. In the meantime great strides were being made on Puget Sound in growing oysters, both the small native species, now known to the trade as the Olympia oyster, and the imported Japanese oyster which has been given the trade name of Pacific oyster. The success of the industry in Puget Sound was mainly due to the employment of trained biologists.

Encouraged by the success of oyster growers on Puget Sound, we decided that, as we have the same native Olympia oyster as well as the Japanese species, and fairly large areas suitable for growing them, a similar industry could be built up in California. We therefore secured the cooperation of the U. S. Bureau of Fisheries who detailed one of their oystermen, H. C. McMillin, to California. We furnished a trained biologist, Paul Bonnot, to act as his assistant. Surveys of all the state tide lands suitable for oysters were made. As a result of this survey new oyster laws were drafted and passed by the legislature to take the

place of the antiquated laws passed in the early 1870's. The new laws provide that state tide lands may be filed upon for oyster cultivation under the administration of the Division of Fish and Game and it is provided that at the discretion of the Division a small revenue shall be paid to cover the cost of administration and the services of an aquatic biologist.

Under the encouragement given, a serious start was made in growing the native oyster in Humboldt Bay and the Japanese oyster in Drake's Bay and Elkhorn Slough. Humboldt Bay was selected as the most favorable locality to develop native oyster growing and the Division, under the authority of the new laws, prohibited the introduction of Japanese or other exotic species in the bay. This was done to guard against the appearance of certain destructive pests, especially the Japanese oyster drill, and to prevent the possible crowding out of the native oyster by a less valuable species.

Fairly large plants of Japanese oysters have been made in Elkhorn Slough on Monterey Bay, San Francisco Bay, Drake's Bay and Tomales Bay. These oysters grow rapidly and it is now certain they can be grown successfully in various localities in the State. This oyster is excellent for canning and for use fresh or frozen, but at the present time the market is not very good and there are more than enough being raised to supply the demand. In addition to this the U. S. markets are being invaded by frozen oysters from Japan at a price so low our growers can hardly compete.

On the other hand, the small native or Olympia oyster has little or no competition. The demand for it is growing and the price advancing. If this oyster can be grown successfully on a commercial scale in Humboldt Bay it will be so much more valuable than either the Japanese or Eastern oyster as to justify all possible assistance and encouragement. This is being rendered by the services of Mr. Bonnot, aquatic biologist, who has continued the work since the withdrawal of the U. S. Bureau two years ago. Humboldt County has given financial aid to the industry and has built for the use of Mr. Bonnot a small but adequate laboratory on the shore of the bay.

For four years several companies have been carrying on and have spent a good deal of money in building dikes and preparing beds. For three years they have put out great numbers of the latest model of oyster collectors. The first year they failed to get a good set, due partly to their lack of experience. Last year they were thoroughly prepared but the water was abnormally cold all season and the oysters failed to make a commercial set. This, with other troubles, was naturally quite discouraging. From experiments it was indicated that Eastern oysters can be successfully grown in the bay from the imported seed, when protected by dikes. To bring in a revenue to the growers while trying to get the native oyster on a paying basis, the Division removed the ban against planting Eastern seed in the bay. Last year a carload of seed was brought out and is now doing wonderfully well.

During the present season the native oyster has made a remarkably good set and the two companies which put out collectors were rewarded with a crop of young oysters that would be considered good on the best of the Olympia beds. Notwithstanding the large importations of Eastern oyster seed which will be planted this fall, it now

seems assured that the growing of native oysters is to be made a commercial success in Humboldt Bay.

SALMON

California's salmon fishery, the oldest and once the most important fishery in the state, continues to decline and it is inevitable that our two species of salmon, the king and silver, will become commercially extinct in California unless more protection is given them. The run of king salmon which ascends the Sacramento and San Joaquin rivers to spawn has been fished harder and over a greater period of years than any of the other runs in the State and it is this run which is in the most serious stages of depletion. This run of salmon has been reduced to a mere vestige of what it was even 20 years ago. The salmon of this run are, most of them, being caught by commercial trollers in the open ocean from Point Reyes to Monterey before they enter San Francisco Bay on their way up the rivers to spawn. River fishermen also take their toll but their seasons have been cut down until they catch only a small number as compared with the outside trollers. Facts relating to the depletion of this once great salmon run as well as what should be done about it are well known.

Fig. 7. Sacramento River salmon catch contrasted with the ocean troll catch landed at Monterey Bay points, at San Francisco and at points in Marin County, from the year 1916 to the year 1935.

We have for many years been pointing out the seriousness of the situation and measures to restrict the intensity of the fishing have been presented to the legislature by the fish and game commissioners, but the measures enacted into law have always been inadequate compromises. Closed seasons, especially for the outside trolling, have not been long enough and such closed seasons as we were able to get have subsequently been shortened. The river fishermen realize that the salmon are depleted, and have voluntarily agreed to greatly shortened seasons which they have not attempted to get extended. The ocean trollers, on the other hand, would sacrifice the salmon for a few years of quick profit.

The depletion of the Sacramento salmon is so obvious that it does not require a complicated statistical analysis to prove it. No one who examines the facts and is interested in conserving our fishery resources

can doubt the seriousness of the depletion, and all will agree that something should be done about it.

The decline in the total catch over a long period, both in the ocean and in the river, as shown in the graphs in Fig. 8 is unmistakable

FIG. 8. Showing the decline in the total river and ocean salmon catch in California since 1916.

FIG. 9. Record of the King Salmon egg take on the Sacramento River at the three stations, Baird, Battle Creek and Mill Creek.

evidence that depletion has been going on for a long time and that the supply of salmon is approaching the vanishing point. It can not be argued that this reduction in the catch is due to restrictions imposed on fishermen, for the number of salmon which escape the fishermen and

get up the river to spawn has been declining even more rapidly than the catch. The decline in the take of eggs at the three spawn-taking stations of the U. S. Bureau of Fisheries on the Sacramento is proof that the number of salmon which escape up the river has been reduced to a small fraction of that of only a few years ago. The salmon hatcheries on the Sacramento are unable to get enough eggs to warrant their operation. This lack of eggs and the inability of the State to give the salmon protection sufficient to give them a supply of eggs for the hatcheries has caused the U. S. Bureau to seriously consider abandoning its salmon culture operations on the river.

What is needed is shorter trolling seasons in the ocean districts, and the closed seasons should be imposed with the object of reducing the catch of salmon, especially during the time they are migrating up the coast and entering the river to spawn.

The Sacramento River season closes on September 17th, at which time the larger fall run is at its height, thus permitting approximately one-third of those entering the bay to pass up the river during the closed time.

We have attempted to get a closed season in the Monterey Bay ocean districts and in the district off San Francisco so as to protect a substantial part of this same fall run as it passes up the coast, first through Monterey Bay and later through the district outside the Golden Gate. The object is to give protection to the latter part of this run, first in Monterey Bay, next in the district north of Santa Cruz and off San Francisco and last in the lower river districts. To do this the season must close early enough in each district to give real protection. The seasons we have now do not give this protection except in the river districts and too large a portion of the run is caught before the salmon can get in the river. What is needed is an earlier closing of the outside seasons.

REPORT OF THE CALIFORNIA STATE FISHERIES LABORATORY

By W. L. SCOFIELD

The Bureau of Commercial Fisheries is applying conservation practice to our fisheries in an attempt to harvest the largest possible annual crop consistent with sustained yield, and the research program is designed to supply the information necessary before such a policy can be carried out. The research work has as its goal the determination, for each of our more important fisheries, the point at which overutilization occurs so that a maximum continuous yield may be established for each fishery. Management of a fishery toward this end usually involves regulation and the research program includes the supplying of information to serve in judging the kind of regulation that will be effective. This necessitates examining the efficiency of the legal restrictions already established. The research work for each fishery is therefore designed to learn the life history and habits of the species as a background for regulation, but the important consideration is a study of possible changes in supply of fish and the causes of such variations.

The greatest yield of our fisheries in both volume and value is from those schooling species which may be caught in quantity and readily preserved by canning. Consequently, our three major research projects include the three groups of fishes caught in greatest amounts and in most danger of over-utilization—sardines, mackerel and the tunas. Our study of the flatfishes of northern and central California is our only major project dealing with a fishery supplying fresh fish markets. In addition to these four major investigations, a number of comparatively minor studies have been completed during the biennium.

To avoid confusion in such a varied program and to systematize its operation, each of certain major projects has been assigned to one staff member to assume responsibility for carrying out the details as planned. In most of the planning, a system of conferences has been followed so that each staff member feels a part of and contributes toward the program as a whole. The major assignments among staff members are as follows:

Sardines—Frances N. Clark.

Mackerel—Donald H. Fry, Jr.

Tuna—H. C. Godsil.

Flatfishes—G. H. Clark.

Compilation of Statistics—Geraldine Conner.

Sport Catch Records—Richard S. Croker.

Before discussing the research projects separately, we wish to point out two important developments that characterize the past biennium. Both result from the appreciative and encouraging attitude of our Commissioners and Executive Officer. The most important is a noteworthy widening of the application of statistics to fish and game management and the second is a general enlargement of our fisheries research program, especially the initiation of fish tagging experiments.

Sardines.

First consideration in our research program has been given to sardines because the volume of the sardine catch in California is more than double the landings of all other species of fish and shellfish combined. The study of this fishery has proven to be the most difficult of our research projects but during the last two or three years the results of our previous work have been clarified with the addition of more information so that now we have a fair working knowledge of this baffling fishery. We have learned the distribution and relative density of the supply, the sizes available, the size composition of the catch, spawning habits, spawning areas, intensity of spawning in various areas, approximate growth rate, size at maturity, migrations, relative measure of natural fluctuations in supply, and roughly a gauge of the effects of man's fishing upon the available supply. We need to perfect our measures of abundance and extend our knowledge of local spawning and nursery grounds, especially in Lower California and along the coast northward from Monterey Bay. We also need to know in greater detail the growth rate of the young fish and should continue to measure the relative strength of each new age class before and after it enters the commercial catch.

An outstanding feature of the recent sardine work is the tagging of fish in an attempt to substantiate our previous determination of migrations. As individual fish are not handled in the reduction plants, we have used an internal tag inserted in the body cavity of the sardine and recovered by electromagnets from the fish meal. This work was started in 1935 and results from it are not yet available.

Mackerel.

The mackerel fishery is our newest large scale industry and our research plans for this species were put into operation a few months after the sudden rise to prominence of mackerel canning. Already we have a satisfactory knowledge of the distribution of the species, the spawning habits, identity of eggs and larvae, proportion of sizes in the commercial catch at San Pedro, size at maturity, age, and rate of growth. We have partial knowledge of the spawning localities with the intensity of spawning in each, but little is yet known of the movements of larvae, young fish or the migrations of the adults. Work with the larvae and young fish is gradually supplying this information and a tagging program has been instituted to determine the volume and extent of adult migrations. A depletion study involving a statistical analysis of individual boat catches is not yet feasible in this new and rapidly changing fishery, but a study of the composition of the commercial catch has suggested a possible criterion for judging relative abundance of supply from year to year.

Tuna.

The tuna fishery is third in volume and second in value among the fisheries industries of the State. At least five different species are involved and the area fished extends from Monterey Bay to below the equator, which offers the possibility of several spawning localities throughout this wide extent with possible local races complicating the problem. As nearly all the tuna fishing is conducted far distant from state waters, a study of this fishery offers difficulties, and we have felt the lack of a research vessel specially assigned to tuna investigations. In spite of the difficulties inherent in this problem, progress has been made in the study of this fishery. As yet the work has necessarily been of a preliminary nature with the gathering of data for future use. A preliminary study was made of the losses of fish due to faulty refrigeration. Catch composition sampling has been initiated, data for growth studies collected, racial studies started, and preliminary spawning data gathered. Scouting trips have been made with two of the patrol boats to locate schools of tuna, specially albacore, for our own information and as an aid to commercial fishermen.

One of the two outstanding accomplishments to date has been the introduction of a system of ships' logs voluntarily kept by boat captains to give us definite records of fishing localities, bait hauls and fishing effort expended in making the catches. A program of tagging the three most important species has also been started to give us knowledge of migrations and to serve as a basis for the solution of some of the other problems of this fishery.

Flatfish.

Our earliest large commercial fishery industry and still our most important fresh market fishery is the trawling for flatfishes in central and northern California. The research work in this fishery has been the gathering of data for life history studies of the several species of fishes making up the commercial catch. Considerable progress has been made in determining the size groups of each species and the species composition of the catch. Data have been collected toward determining growth rate, size at maturity and spawning characteristics for each species. The outstanding accomplishment so far has been the persuasion of the fishermen to adopt larger meshed savings gear, thereby reducing the wastage of young fish. Experimental hauls are now being made with other types of trawl nets and of various sizes of mesh to determine for the industry the most efficient gear. A less spectacular but equally important accomplishment has been the introduction of detailed fishing logs on the boats and a recording of the yield from numbered block areas of the ocean. This is a basis for depletion studies which have been started.

Minor Research Projects.

Minor research studies range from a special report, which may require only a week or two in preparation, to investigations extending over two or three years, but as contrasted with the major portions of our program they are relatively of short duration and temporary importance. For example, several reports have been made on the fish or clam resources of limited areas for use in the state legislature, and others have covered the character of the commercial catch of some species. Two more extensive minor studies are the experiments in the tagging of striped bass in the San Francisco Bay and river area to determine migrations, and the annual census of the population of clams at Pismo Beach to measure the rate of depletion and the possible beneficial effects of the area closed to clam digging.

Boat Trips.

In the absence of a special research vessel, the ocean work has been carried on by an arrangement for part time use of the two patrol boats, *Blucfin* and *Albacore*, supplemented by trips on board vessels of the commercial fishing fleet. The nature of our work during the last two years has called for an increasing amount of time spent at sea by staff members. The longer voyages of two to six weeks have usually been made by the *Blucfin*, and many of the shorter trips of two to twenty days have been made aboard the *Albacore*. During the biennium, 37 important research trips were made, 21 by the *Blucfin* and 16 by the *Albacore*. On four occasions, one-day trips employed the patrol boat *Broadbill*. H. C. Godsil made three long tuna tagging voyages into southern waters aboard one of the tuna vessels of the commercial fleet, and other staff members have made numerous one- and two-day trips with commercial fishermen.

Publications.

The results of the research work are reported and in most cases published for distribution. The more comprehensive reports are issued

in the series called "Fish Bulletins," and less extensive articles are printed in the quarterly magazine, "California Fish and Game." Popular accounts of the results are frequently published in trade journals or in the Department of Natural Resources monthly magazine, "California Conservationist," and occasionally in eastern or foreign biological journals. Results of special interest to a portion of the fish trades are sometimes mimeographed for distribution, but more frequently special reports are intended primarily for the administrative officers of the Division and are submitted in typewritten form.

During the biennium, the following six Fish Bulletins were issued:

- No. 41. Early life-history of the California sardine (*Sardina caerulea*), with special reference to distribution of eggs and larvae. By Eugene C. Scofield.
- No. 42. Maturity of the California sardine (*Sardina caerulea*), determined by ova diameter measurements. By Frances N. Clark.
- No. 43. The sizes of California sardines caught by the different fishing gear and in the different localities of the Monterey and San Pedro regions. By the California State Fisheries Laboratory.
- No. 44. The commercial fish catch of California for the years 1930-1934, inclusive. By the Staff of the Bureau of Commercial Fisheries.
- No. 45. The sharks and rays of California. By Lionel A. Walford.
- No. 46. A contribution toward the life histories of two California shrimps, *Crago franciscorum* (Stimpson) and *Crago nigricauda* (Stimpson). By Hugh R. Israel.

Fourteen articles dealing with fisheries problems were prepared by staff members for the magazine, "California Fish and Game," as listed below:

Forecast for the 1935-1936 sardine season.

CLARK, FRANCES N.

A summary of the life-history of the California sardine and its influence on the fishery.

CLARK, G. H.

The California trawl fishery and its conservation.
San Francisco trawl fishery.

CROKER, RICHARD S.

Sardine canning in California.
Smoked, salted and dried sea-foods of California.
What is the world's greatest fishing port?

FRY, DONALD H., JR.

A description of the eggs and larvae of the Pacific mackerel (*Pneumatophorus diego*).

A preliminary summary of the life history of the Pacific mackerel (*Pneumatophorus diego*).

Mackerel: Can the fishery continue?

PHILLIPS, J. B.

The crab fishery of California.

Experiment to determine the feasibility of the use of trammel nets in Monterey Bay.

SCOFIELD, W. L.

The harvesting of giant kelp in California.

TIBBY, RICHARD B.

The construction of the purse seine as used in the San Pedro Sardine fishery, 1935-1936 season.

The following were published or presented for publication in other periodicals:

CLARK, FRANCES N.

Variations in the number of vertebrae of the sardine, *Sardinops caerulea* (Girard). *In* Copeia.

CLARK, G. H.

San Francisco drag boat fishery. *In* Pacific Fisherman.

FRY, DONALD H., JR.

Sharp-headed finner whale taken at Los Angeles Harbor. *In* Journal of Mammalogy.

GODSIL, H. C.

Tuna tagging. *In* Journal du Conseil, International Council for the Exploration of the Sea.

Statistics.

For many years very comprehensive statistical data have been collected and compiled to give the detailed catch of commercial fishing boats, the registration of boats, fishing gear and licenses sold. For several years the catch data have been compiled by the use of punched cards and electrically operated sorting and tabulating machines. Beginning in 1932, the deer kill of the State has been so tabulated from the returned deer tags.

The past biennial period has seen the extension of the statistical work to include three phases of fish and game management, formerly administered without statistical knowledge, to serve as a sound administrative basis. These three extensions of statistical records cover marine sport angling, hunting and fresh-water angling.

For several years, preliminary data were kept for the ocean sport catch by a selected sample of boat, barge and pier operators who generously volunteered to keep the records for us. Beginning with the first of 1936, this work was systematized and extended to include practically all boat operators, and the results promise to be very valuable in the management of the marine fishes.

Beginning in 1935, the game kill for the preceding year and the fresh-water angling catch of the state were recorded on the applications for hunting or angling licenses. These records, although admittedly faulty in some respects, serve as the first attempt in this State to compile a statistical summary of the annual harvest of game animals and stream fishes, and with future improvements should lay the basis for better management of the resources.

The punched card system, with some enlargement in equipment and personnel, is handling the five types of records mentioned—commercial fish catch, deer kill, marine sport catch, hunting returns, and fresh-water angling. In addition the punched card setup of personnel and equipment has rendered invaluable service in producing many special reports, covering a wide range of subjects and prepared as aids to the research staff, administrative officers of the Division, legislative committees, and outside agencies such as federal officers and organizations of fishermen and packers.

WPA Projects.

Five WPA projects in connection with fisheries research have operated successfully, the most important of which is the erection of a

38x53 foot two-story concrete building on Terminal Island for the handling and storage of statistical records. This building, begun on March 2, 1936, was about three-quarters completed by June 30. The earliest project, starting with the SERA, was for clerical help at the Terminal Island Laboratory and has assisted us materially ever since. An experienced boatman is being furnished by WPA to assist in the experimental fishing involved in our studies of the flatfishes, and at Stanford University another WPA man is working up the data collected in connection with our studies of the trawler fisheries of northern California. For short intervals as needed, competent translators of foreign languages have been supplied by WPA.

Cooperation with Stanford University.

Too frequently all the cooperating is on one side but our arrangement with Stanford University is exceptional in that both sides in this agreement do their full share and a beneficial and smoothly operating program has resulted. Starting in 1929, the university and the State have cooperated in conducting a hydrobiological survey of Monterey Bay. During the biennium, Dr. Tage Skogsberg of Stanford University reported in full for publication the first five years' results.

Public Talks.

When called upon, staff members give talks on conservation, fisheries of the state, and fisheries research before scientific societies, nature clubs and local sport or service organizations. During the biennium, 41 such talks were given by the staff.

Library.

With the establishment of the Laboratory in 1917, it was essential to start a collection of literature on marine biology, especially fish, fisheries, oceanography and related subjects, and also statistical methods. This was primarily for the use of the research workers engaged in fisheries investigations for the Division of Fish and Game. Since its origin, the library has expanded and is consulted not only by the laboratory staff but by scientists of other government and private agencies, professors and students, canners, sport and commercial fishermen and various commercial firms interested in fisheries or allied industries.

In its archives are United States and foreign government documents, state reports, trade and scientific periodicals, publications of scientific societies and institutions, in addition to textbooks and reference books. A large proportion of the acquisitions are obtained by exchanging the publications of the Division with those of other organizations. The library now contains 1905 volumes and 25,420 pamphlets.

During this biennial period, considerable work was done on the subject and author catalog of the literature in the library. This catalog has proven indispensable in making the books and publications readily available to the users. In addition to this general catalog, special bibliographies are available for reference. In 1935, an author and subject index to the quarterly magazine, "California Fish and Game," volumes 1 to 20, was compiled.

FISH EXCHANGE UNIT

The activities of the Fish Exchange unit of this bureau were brought to a close on June 30, 1935, as required by the Statutes of 1933, Chapter 825.

During the fiscal year 1934-1935 the activities of the Exchange were increased. An additional supervisor of fresh fish marketing was appointed and took charge of the work in southern California.

A very extensive publicity campaign was carried on to acquaint the public with the valuable health-giving minerals of fresh fish by furnishing to the dealers, for general distribution to their customers, the pamphlet "Reasons Why You Should Make Tuesday Fish Day Too." An animated exhibit was shown at the following fairs and food shows with an attendance of more than 1,700,000 as indicated below:

Northern District			
	<i>Attendance</i>	<i>Pamphlets</i>	<i>Recipe books</i>
San Joaquin County Fair, Stockton	135,000	1000	1200
Sacramento State Fair-----	453,000	5000	2400
San Francisco Food Show-----	161,742	8100	500
Sportsmen's Carnival, Oakland	24,000	2300	10
Southern District			
Los Angeles County Fair, Pomona	445,000	6500	2900
Southern California Retail Grocers Association Food Show, Los Angeles-----	255,000	8200	46
National Orange Show, San Bernardino	203,000	9850	196
Western Sports Show, Los Angeles-----	14,000	3300	10
Ralph's Food Show, Burbank--	25,000	5200	50

The total amount of pamphlets distributed during the year ending June 30, 1935, was as follows: northern district 58,614; southern district 153,452.

At the food shows a home economics instructor was employed to give continuous cooking demonstrations of the many varieties of local fish. These demonstrations attracted chefs, public school domestic science teachers, trade school teachers and thousands of housewives who were eager to learn how to prepare sea foods.

During the year all handlers of fresh fish were visited, some of them several times, to assist in a better and more economical distribution by wholesalers to retailers and by retailers to the public. Over 1200 retail dealers were contacted. Of these, 227 were chain stores and 722 were independent stores, 589 used mechanical refrigeration and 732 used ice for keeping the fish fresh; 62 had window displays and 893 had show case displays. Questioned as to what fish was the best seller, 424 said sea bass, 311 said halibut and 251 gave salmon. Reports on frozen fish sales showed 64 as good, 229 as favorable and 380 as unfavorable. Five hundred thirty-one dealers carried fish as an accommodation and 401 dealers showed their fish sales as a profitable item. Five hundred seven dealers used various forms of publicity to push their sales.

Additional printings of the fish recipe book were made and distributed, 56,888 in the northern and 53,043 in the southern part of California.

REPORT OF THE BUREAU OF HYDRAULICS

By JOHN SPENCER, Chief

The Bureau of Hydraulics was reestablished and the writer was placed in charge on November 15, 1935. The work on the pollution of public waters has been transferred to another bureau.

When the bureau was reestablished efforts were being made to obtain federal funds to provide for the installation of fish screens, the general plan contemplating the protection of about 250 ditches in the Klamath Basin in Siskiyou County. These funds failed to materialize, because of changes in the WPA procedure. Plans were prepared, however, for a number of different sized diversions, and should the present efforts to obtain federal funds be successful plans and specifications previously prepared will be suitable.

In the early part of the year portions of the fishway on the Berbow Dam on the South Fork of the Fel River were carried away by exceptionally high waters, and plans have been prepared for the reinstallation of this fishway. Work is now in progress and it is expected that the installation will be completed prior to the next upward movement of fish.

Routine work on inspection of fishways and fish screens, together with plans for installation of new ones is being carried forward as dictated by conditions.

In April, 1936, the Commission purchased an electric fish stop invented by Mr. H. T. Burkey. This device was installed on a diversion from the Shasta River, Siskiyou County, owned by the Grenada Irrigation District and Mr. Louis Foulke, for the purpose of demonstrating its effectiveness as a fish stop and general practicability in operation. Mr. Burkey selected the site for this screen and installed it to his satisfaction. The Commission placed an attendant at the screen, and netting operations were carried on below this electric screen for sixty days.

Data were obtained as to the number and kinds of fish passing through the screen, together with a graphic record of voltage and amperage, electric energy used, etc.

The data indicate that fish passed on down the diversion, even though voltage and other changes were made in the apparatus in the effort to make it operate effectively. Finally the installation was dismantled, as it appeared that no useful purpose would be served by continuing it in operation.

Experimental work as well as installations of electric fish stops have been carried on by interested parties for at least twenty years. No reports are available that may be accepted as showing the effectiveness of this method of preventing the loss of fish.

REPORT OF THE BUREAU OF LICENSES

By H. R. DUNBAR, Chief

As the work of the Division, in carrying on the conservation and propagation of fish and game, is supported entirely by the sale of licenses, income from privilege taxes and fines for violations of the fish and game laws, it is gratifying to report that the income for the biennium just ended shows a marked increase over the previous biennial period.

Following is a comparative statement showing the revenue from license sales and other sources for each fiscal year since 1928-29, which shows the trend of increase or decrease during that period:

<i>Fiscal Year</i>	<i>License Sales</i>	<i>Other Income</i>	<i>Total</i>
1928-1929	\$1,126,297 50	\$276,019 88	\$1,402,317 38
1929-1930	1,134,689 92	297,043 29	1,431,733 21
1930-1931	1,159,367 20	199,744 27	1,359,111 47
1931-1932	1,128,477 70	149,671 10	1,278,148 80
1932-1933	974,068 92	161,286 02	1,135,354 94
1933-1934	881,421 73	275,442 74	1,156,864 47
1934-1935	916,885 84	356,555 52	1,273,441 36
1935-1936	1,091,672 50	345,974 96	1,437,647 46

On June 30, 1936, the sum of \$304,215 was being held in Bond Deposits for account of the following licenses:

Hunting, 1935-36	\$22,593 00
Hunting, 1936-37	10,145 00
Angling, 1936	269,967 00
Deer tag, 1936	1,010 00
Market, 1936-37	500 00
Total	\$304,215 00

Practically all of the Bond Deposit money will be credited to the fiscal year beginning July 1, 1936.

Following are statements of the sale of hunting, angling, deer tag and market licenses, by license years, and the income from privilege taxes and court fines by fiscal years. The purpose of presenting these statements is to demonstrate the decrease and increase of the principal sources of income during the depression period.

HUNTING

<i>Year</i>	<i>Value</i>	<i>Number</i>

1935-1936 -----	49,469 32

Effective January 1, 1935, with the issuance of the 1935 series of angling licenses, a new style identification button was adopted. This button is oblong in shape, $2\frac{1}{4}$ inches long by $1\frac{1}{2}$ inches wide, with an open face window, $1\frac{1}{8}$ inches long by $1\frac{1}{8}$ inches wide. The form of the printed license was such that when folded and inserted in the badge, the person's name, personal description and signature were visible. This style badge proved very satisfactory with the sportsmen and made the work of the wardens, in checking licenses, much easier. By authority vested in the Commission by section 400 of the Fish and Game Code, it has been ordered that the badge must be worn on the outside of the clothing above the waist line and to be visible at all times. This same style badge was adopted for the hunting license also. A distinction between the two licenses is made

by printing across the face of the license the word "Angling" or "Hunting" together with the year.

During the 1935 session of the state legislature, a law was passed providing that a license would be required by the owner of any vessel, who for profit, transported persons to any area for the purpose of fishing. The fee for this license is \$1. As of June 30, 1936, 210 boat operator permits were issued.

The application of section 421 of the Fish and Game Code, regarding the requirement of an angling license to angle for game fish in the ocean has increased the angling license sales for the period ending June 30, 1936, of the current series, by approximately \$50,000.

The 1935 session of the legislature passed another law requiring that in addition to the payment of the privilege tax, a tax of one-half cent be paid on each pound of salmon received, based on the weight in the round. For the period ending June 30, 1936, the sum of \$1,998.78 has been paid.

The law provides that licenses shall be issued free of charge as follows: Hunting and angling licenses to Veterans of the Civil War and angling licenses to indigent Indians, who have not been previously convicted for a violation of the fish and game laws. During the angling season of 1935 and the hunting season of 1935-36, nineteen angling and seven hunting licenses were issued to Veterans of the Civil War. For the six month's period ending June 30, 1936, one hundred seventy-six free angling licenses were issued to Indians.

In the distribution of the 1935-36 series of hunting licenses a new form of application was adopted in which the cooperation of the sportsmen is asked in giving certain information as to the number of each species of game taken in the previous season and the county in which they were taken. The results obtained were so satisfying that the plan has been adopted with the issuance of the angling licenses also.

At the present time, licenses are distributed throughout the State to agencies by three methods: viz. to county clerks, who redistribute them to agencies in their own counties; to agents who pay cash in advance; and to agents, who first have been placed under bond, on a credit basis. It is believed that better distribution, a more prompt accounting of the license sales and a better control of the agencies, could be had if the distribution were centered in one direct method. It is our recommendation that the Commission consider having the law, in so far as it applies to license distribution, amended at the next session of the legislature to provide for one method of direct distribution to agencies by the Division offices.

In the appendix, statements may be found, showing the sales of the different kinds of licenses for the years 1934 and 1935.

STATISTICAL REPORTS

STATEMENT OF INCOME

July 1, 1934, to June 30, 1935, of the Eighty-sixth Fiscal Year

FISH AND GAME PRESERVATION

Current Year:		
License sales—		
Angling licenses, 1934	\$346,409 50	
Angling licenses, 1935	2,573 00	
Commercial hunting club licenses, 1934-35	1,225 00	
Commercial hunting club operators' licenses, 1934-35	265 00	
Deer tags, 1934	108,919 00	
Deer tags, 1935	4 00	
Fish breeders' licenses, 1934	25 00	
Fish breeders' licenses, 1935	330 00	
Fish importers' licenses, 1934	35 00	
Fish importers' licenses, 1935	85 00	
Fish packers' and wholesale shell fish dealers' licenses, 1934-35	930 00	
Game breeders' licenses, 1934	115 00	
Game breeders' licenses, 1935	977 50	
Hunting licenses, 1933-34	3,931 50	
Hunting licenses, 1934-35	315,593 34	
Hunting licenses, 1935-36	27 00	
Kelp licenses, 1934	20 00	
Kelp licenses, 1935	30 00	
Market fishermen's licenses, 1934-35	28,790 00	
Market fishermen's licenses, 1935-36	24,920 00	
Trapping licenses, 1934-35	1,681 00	
Total license sales	\$916,885 84	
Other income:		
Court fines	\$30,400 42	
Fish packers' tax	305,386 08	
Fish tag sales	2,555 60	
Game tag sales	137 25	
Importers' contributions	315 00	
Interest on bank balances	6,201 93	
Kelp tax	99 77	
Lease of kelp beds	1,309 20	
Miscellaneous sales	3,603 82	
Publication sales	546 45	
Total other income	\$356,555 52	
Prior year—85th:		
Dividends, California National Bank	\$18,545 08	
Dividends, Trinity County Bank at Weaverville	178 50	
Total prior year	\$18,723 58	
Grand total Fish and Game Preservation Fund	\$1,254,717 78	
Revenue for the General Fund (part of)		
Unclaimed checks and deposits	168 15	
Grand total of all funds	\$1,254,885 93

REPORT OF SARDINE PLANTS, SEASON 1934-35

The season opened in Monterey and northern California on August 1st. However, as the price for sardines was not agreed on until August 11th no fish were brought in until August 13th (except a few tons received by one plant at Monterey from its own boats which started delivering on August 7th). In the San Pedro district the season opened on November 1st and fish were received on the opening day.

This report covers operations of shore plants only, and does not include sardines taken for fresh fish markets, bait, or quarter oil pack. During the season three floating reduction plants operated off the California coast, outside the jurisdiction of the State, and it is estimated that the floating plants took 128,190 tons of sardines. This amount added to the tonnage taken by shore plants makes a total of 608,936 tons of sardines taken off the coast of California during the season.

The following plants operated during the season:

MONTEREY AND NORTHERN CALIFORNIA DISTRICT

Benicia Fisheries, Benicia.
F. E. Booth Co., Inc., Monterey.
F. E. Booth Co., Inc., Pittsburg.
California Packing Corporation, Monterey.
Carmel Canning Company, Monterey.
Custom House Packing Corporation, Monterey.
Del Mar Canning Corporation, Monterey.
E. B. Gross Canning Co., Monterey.
Hovden Food Products Corporation, Monterey.
Monterey Canning Company, Monterey.
Old Capitol Land Company, Monterey.
Old Capitol Packers, Inc., Benicia.
Pittsburg Cannery, Inc., Pittsburg.
Richmond Fisheries, Inc., Richmond.
San Carlos Canning Company, Monterey.
San Xavier Fish Packing Co., Monterey.
Sea Pride Packing Corporation, Ltd., Monterey.
Clayton L. Shaff, Monterey.
Union Fish Co. (Barge PERALTA), San Francisco.

SAN PEDRO DISTRICT

California Packing Corporation, Terminal Island.
Coast Fishing Co., Wilmington.
Franco-Italian Packing Co., Terminal Island.
French Sardine Co., Inc., Terminal Island.
Italian Food Products Co., Inc., Long Beach.
Seaboard Packing Corporation, Long Beach.
Sea Pride Packing Corporation, Ltd., Terminal Island.

Sea Pride Packing Corporation, Ltd., Wilmington.
 Southern California Fish Corporation, Terminal Island.
 Van Camp Sea Food Co., Inc., Terminal Island.

SAN DIEGO DISTRICT

Point Loma Tuna Packers, Inc., Point Loma.
 Westgate Sea Products Co., San Diego.

PRODUCTION OF SARDINE PLANTS

August 1, 1934, to March 31, 1935

District	Sardines received, tons	Used for canning, tons	Used for meal and oil, tons	Offal, tons

REPORT OF SARDINE PLANTS, SEASON 1935-36

The season opened in Monterey and northern California on August 1st and small deliveries for canning purposes were made throughout the month. Permits for use of fish by a reduction process were not issued until September 1st, when rather heavy fishing was started. In southern California the season opened on November 1st and permits for use of fish by a reduction process were available on the same date. However, deliveries were light until the latter part of the month. Permits to take fish for use by a reduction process were not issued in Monterey and northern California after January 31st and in southern California after March 15th.

This report covers operations of shore plants only and does not include sardines taken for fresh fish markets, bait or quarter-oil pack. During the season the floating reduction ships *Lake Miraflores*, *Lansing*, *Santa Inez* and *Brookdale* operated off the coast of California outside the jurisdiction of the state, and it is estimated that the four floating plants took 158,754 tons of sardines. This amount added to the tonnage taken by the shore plants makes a total of 565,920 tons of sardines taken off the coast of California during the season.

The following plants operated during the season :

MONTEREY AND NORTHERN CALIFORNIA DISTRICT

Benicia Fisheries, Benicia.
 F. E. Booth Co., Inc., Monterey.
 F. E. Booth Co., Inc., Pittsburg.
 California Packing Corporation, Monterey.
 Carmel Canning Company, Monterey.
 Custom House Packing Corporation, Monterey.
